PREFACE

This is one of two volumes presenting final vital statistics for the United States, its Territories, and two possessions for the year 1954. Their subject matter consists of vital events that occurred in these areas during the year—marriages, divorces, births, fetal deaths, infant deaths, and deaths among the general population.

This annual report is organized as follows:

Volume I. Introduction and Summary Tables.

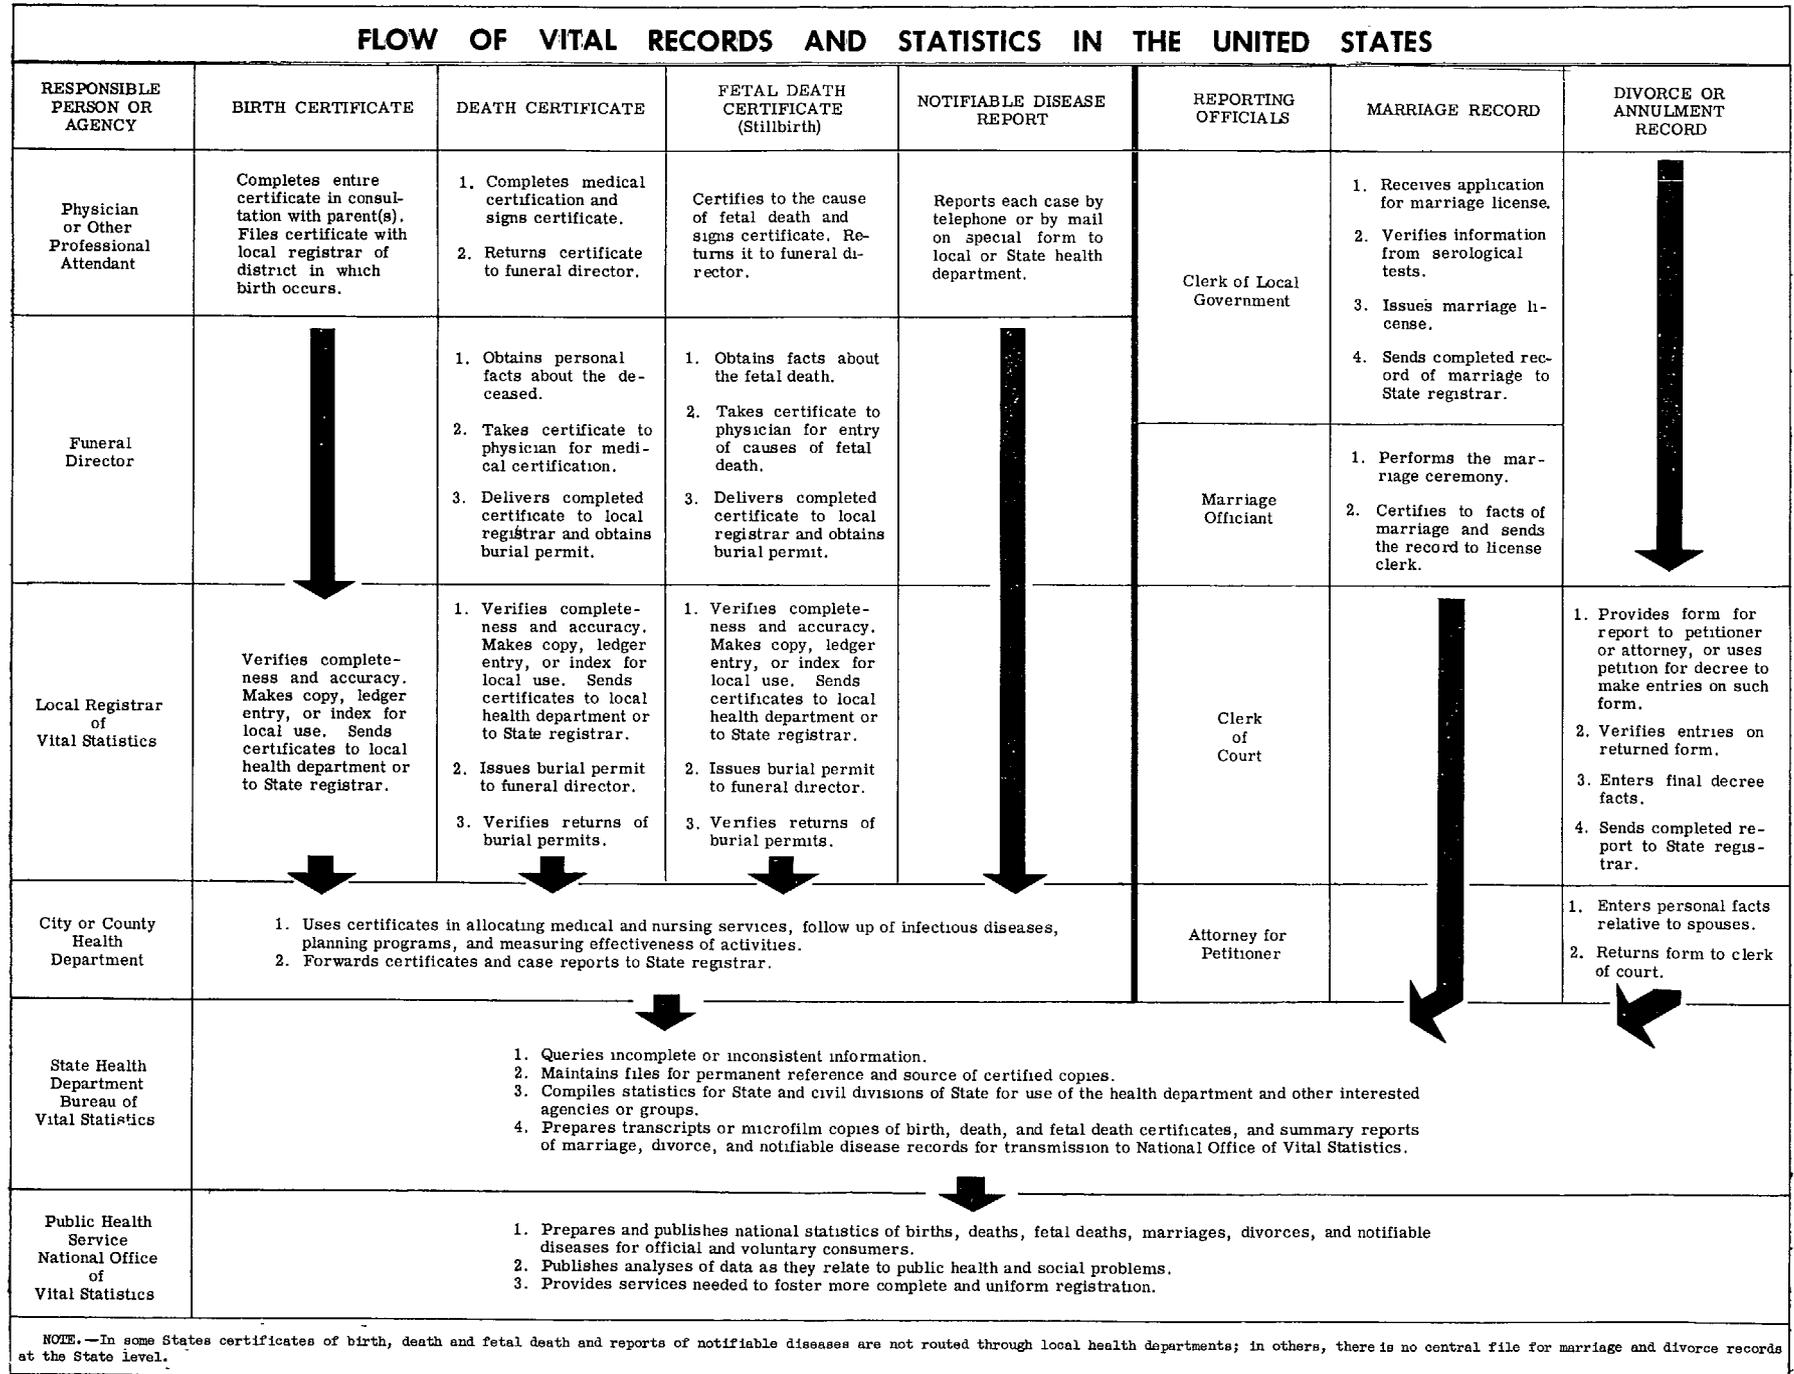

Tables containing data for Alaska, Hawaii, the Commonwealth of Puerto Rico, and the Virgin Islands (U. S.).

Marriage, Divorce, Natality, Fetal Mortality, and Infant Mortality Data for the United States and each State.

Volume II. Mortality Data for the United States and each State.

In using statistics from either volume, it is recommended that reference be made to the explanatory text in Volume I, which describes the sources and limitations of the data.

CONTENTS

Introduction

	Page		Page
Introduction -----	IX	Classification of Data—Continued	
Sources of Data -----	IX	Gestation period-----	XVII
Birth, death, and fetal death statistics -----	IX	Fetal deaths-----	XVII
Marriage and divorce statistics -----	IX	Cause of death-----	XIX
Notifiable disease statistics -----	IX	Control of errors-----	XX
Standard certificates -----	IX	Interpretation of Data -----	XX
Classification of Data -----	XIII	Small frequencies -----	XX
Geographic classification-----	XIII	Sampling of birth records -----	XXI
Massachusetts data -----	XIII	Completeness of registration-----	XXI
Age -----	XIII	Population bases -----	XXII
Nativity -----	XV	Life table statistics -----	XXII
Race -----	XV	Residence statistics-----	XXII
Births in hospitals -----	XVI	Territories and possessions-----	XXVII
Birth weight-----	XVI	Guide to tabulations -----	XXVII
Illegitimate births-----	XVI	Explanation of the columns of the life table-----	XLV

TEXT AND SUMMARY TABLES

	Page
A. Metropolitan counties in each State: United States-----	XIV
B. Deaths by single years of age, at ages 85 years and over, by race and sex: United States, 1954 -----	XV
C. Minimum periods of gestation for fetal death registration and fetal deaths by place of occurrence and period of gestation: United States and each State, 1954-----	XVIII
D. Sampling errors in birth statistics: 1954 -----	XXI
E. Live births to nonresidents in each State and live births to residents in other States: United States, 1954 -----	XXIV
F. Deaths of nonresidents in each State and deaths of residents in other States: United States, 1954 -----	XXV
G. Number and percentage distribution of marriages in State of occurrence, by resident status of bride and groom: 27 reporting States, 1954 -----	XXVI
H. Guide to the tabulations for 1954-----	XXVIII
I. Estimated total population including armed forces overseas, by age, race, and sex: United States, 1954 -----	XXIX
J. Estimated total population residing in continental United States (excluding armed forces overseas), by age, race, and sex: 1954-----	XXIX
K. Estimated total population (excluding armed forces overseas) by age: United States, each division and State, 1954 -----	XXX
L. Population; marriages, divorces, live births, and deaths; and crude rates: United States, 1940-54-----	XXXI
M. Fetal deaths and ratios; infant, neonatal, and maternal deaths, and rates: United States, 1940-54-----	XXXI
N. Vital statistics rates by month: United States, 1954 -----	XXXI
O. Crude marriage and divorce rates: United States, each division and State, 1950-54-----	XXXII
P. Crude birth and death rates: United States, each division and State, 1950-54 -----	XXXIII
Q. Fetal death ratios; infant, neonatal, and maternal mortality rates; by race: United States, each division and State, 1954-----	XXXIV
R. Median age of bride and of groom at marriage, by previous marital status: 19 reporting States, 1954 -----	XXXV
S. Median age of bride and of groom by specified age of spouse, at first marriage of both: Total of 21 reporting States, 1954 -----	XXXV
T. Percentage distribution of marriages by previous marital status of bride and groom: Total of 20 reporting States, 1954 -----	XXXV
U. Median age of bride and of groom at first marriage and at remarriage, by race: 21 reporting States, 1954 -----	XXXVI
V. Percentage distribution of divorces and annulments by number of children reported: 22 reporting States, 1954 -----	XXXVI
W. Divorces and annulments by median duration of marriage in years: 23 reporting States, 1954 -----	XXXVI
X. Percentage distribution of registered live births by attendant, by race: United States, each division and State, 1954 -----	XXXVII
Y. Birth rates by age of mother, race, and live-birth order: United States, 1953 and 1954 -----	XXXVIII
Z. Birth rates adjusted for underregistration, by age of mother, race, and live-birth order: United States, 1953 and 1954-----	XXXIX
AA. Birth rates adjusted for underregistration, by age of mother and race: United States, 1940-54 -----	XL
AB. Birth rates adjusted for underregistration, by live-birth order and race: United States, 1940-54-----	XLI
AC. Birth rates adjusted for underregistration, by age of father: United States, 1940-54-----	XLII
AD. Statistics on live births for specified characteristics: United States, 1954-----	XLII
AE. Gross and net reproduction rates by race: United States, 1940-54 -----	XLII

TEXT AND SUMMARY TABLES—Continued

Table	Page
AF. Percentage distribution of registered live births by birth weight, by race: United States and each geographic division, 1954-----	XLIII
AG. Monthly indexes of first births and other live births: United States, 1954-----	XLIII
AH. Estimated number and ratio of illegitimate live births, by age of mother and race: United States, 1954-----	XLIII
AI. Ratio of illegitimate live births by race: 35 reporting States, 1954-----	XLIV
AJ. Fetal deaths and fetal death rates by age of mother, race, and sex: United States, 1954-----	XLIV
AK. Abridged life table for the total population: United States, 1954-----	XLV
AL. Abridged life tables by race and sex: United States, 1954-----	XLVI
AM. Life table values for selected specific ages, by race and sex: United States, 1949-51, 1953, and 1954-----	XLVII
AN. Deaths including those among the armed forces overseas and death rates for males, by age and race: United States, 1950-54-----	XLVIII
AO. Death rates by age, race, and sex: United States, 1940-54-----	XLIX
AP. Death rates by age: United States, each division and State, 1950 and 1954-----	LI
AQ. Death rates for 64 selected causes, by age, race, and sex: United States, 1954-----	LII
AR. Crude death rates for 64 selected causes: United States, each division and State, 1954-----	LX
AS. Reported cases of specified notifiable diseases: United States, each division and State, 1954-----	LXIV

FIGURES

Figure	
1. Flow of vital records and statistics in the United States-----	IV
2. Standard Certificate of Live Birth-----	X
3. Standard Certificate of Death-----	XI
4. Standard Certificate of Fetal Death (Stillbirth)-----	XII

Territories and Possessions

Table	
1. Marriages by age of bride, by age of groom: Specified areas, 1954-----	3
2. First marriages by age of bride, by age of groom: Specified areas, 1954-----	4
3. First marriages and remarriages, by age and race of bride and of groom: Specified areas, 1954-----	5
4. Marriages by age and number of present marriage of bride and of groom: Specified areas, 1954-----	6
5. Marriages by age and previous marital status of bride and of groom: Specified areas, 1954-----	7
6. Marriages by previous marital status of bride, by previous marital status of groom: Specified areas, 1954-----	8
7. Marriages by resident status of bride and groom: Specified areas, 1954-----	8
8. Marriages by month: Specified areas, 1954-----	8
9. Divorces and annulments by month: Specified areas, 1954-----	8
10. Divorces and annulments by legal grounds for decree: Specified areas, 1954-----	9
11. Divorces and annulments by party to whom granted: Specified areas, 1954-----	9
12. Divorces and annulments by number of children reported: Specified areas, 1954-----	9
13. Divorces and annulments by duration of marriage in years: Specified areas, 1954-----	9
14. Live births and deaths by specified race and sex: Specified areas, 1954-----	9
15A. Live births by attendant and birth weight; fetal deaths; and total, infant, and neonatal deaths; by race: Alaska, each judicial division and district, and specified urban places, 1954-----	10
15B. Live births by attendant and birth weight; fetal deaths; and total, infant, and neonatal deaths; by race: Hawaii, each county, and specified urban places, 1954-----	13
15C. Live births by attendant and birth weight; fetal deaths; and total, infant, and neonatal deaths; by race: Puerto Rico, each municipality, and specified urban places, 1954-----	14
15D. Live births by attendant and birth weight; fetal deaths; and total, infant, and neonatal deaths; by race: Virgin Islands, each municipality, and specified urban places, 1954-----	18
16. Live births by month, race, and sex: Specified areas, 1954-----	19
17. Live births by age of mother, race, and live-birth order: Specified areas, 1954-----	20
18. Cases of plural births classified by number of children born alive and born dead, by race: Specified areas, 1954-----	22
19. Live births by birth weight and race: Specified areas, 1954-----	22
20. Fetal deaths by month and race: Specified areas, 1954-----	23
21. Fetal deaths by age of mother and race: Specified areas, 1954-----	23
22. Fetal deaths by birth weight and race: Specified areas, 1954-----	24
23. Fetal deaths by period of gestation and race: Specified areas, 1954-----	24

TERRITORIES AND POSSESSIONS—Continued

Table	Page
24. Deaths under 1 year, by detailed age, race, and sex: Specified areas, 1954-----	25
25. Deaths under 1 year and under 28 days, by month and race: Specified areas, 1954-----	26
26. Deaths under 1 year, under 28 days, and 28 days to 11 months, from 45 selected causes, by race: Specified areas, 1954-----	27
27. Deaths by month, race, and sex: Specified areas, 1954-----	29
28. Deaths from 64 selected causes, by age, race, and sex: Specified areas, 1954-----	30

Marriages and Divorces

1. Marriages by month: 34 reporting States, 1954-----	49
2. Marriages by age of bride, by age of groom: Total of 28 reporting States, 1954-----	50
3. First marriages by age of bride, by age of groom: Total of 21 reporting States, 1954-----	51
4. All marriages, first marriages, and remarriages, by age and race of bride and of groom: Total of 19 reporting States, 1954-----	52
5. First marriages and remarriages, by age and race of bride and of groom: 23 reporting States, 1954-----	54
6. Marriages by age (single years 15 through 44) and previous marital status of bride and of groom: Total of 19 reporting States, 1954-----	59
7. Marriages by age and previous marital status of bride and of groom: 21 reporting States, 1954-----	60
8. Marriages by previous marital status of bride, by previous marital status of groom: 21 reporting States, 1954-----	65
9. Marriages by age (single years 15 through 44) and number of present marriage of bride and of groom: Total of 14 reporting States, 1954-----	66
10. Marriages by age and number of present marriage of bride and of groom: 16 reporting States, 1954-----	67
11. Marriages by State of occurrence distributed according to State of residence of bride and of groom: 20 reporting States, 1954-----	71
12. Divorces and annulments by month: 32 reporting States, 1954-----	74
13. Divorces and annulments by legal grounds for decree: 24 reporting States, 1954-----	75
14. Divorces and annulments by party to whom granted: 24 reporting States, 1954-----	76
15. Divorces and annulments by number of children reported under 18 years of age: 22 reporting States, 1954---	76
16. Divorces and annulments by duration of marriage in years: 23 reporting States, 1954-----	77
17. Divorces and annulments by State of occurrence distributed by State where marriage was performed: 10 reporting States, 1954-----	78

General Natality and Mortality

18. Live births by attendant and birth weight; fetal deaths; and total, infant, and neonatal deaths; by race: United States, each State and county, and specified urban places, 1954-----	81
19. Live births by attendant and birth weight; fetal deaths and ratios; total deaths; and infant and neonatal deaths and rates; by race for urban and rural areas in metropolitan and nonmetropolitan counties: United States and each State, 1954-----	180

Live Births

20. Live births by State of occurrence distributed according to State of residence: United States and each State, 1954-----	199
21. Live births by month, race, and sex: United States and each State, 1954-----	202
22. Live births by specified race and sex: United States and each State, 1954-----	207
23. Live births by age of father, race, and sex of child for the United States and each State; and by age of mother for the United States: 1954-----	208
24A. Live births by age of mother, live-birth order, sex of child, race, and nativity of white mother: United States, 1954-----	215
24B. Live births by age of mother, live-birth order, race, and nativity of white mother: Each State, 1954-----	218
25. Live births by single year of age of mother, live-birth order, race, and nativity of white mother: United States, 1954-----	259
26. Cases of plural births classified by number of children born alive and born dead, by race and sex for the United States and each State; and by age of mother for the United States: 1954-----	262
27. Illegitimate live births by age of mother and race: Each reporting State, 1954-----	267
28. Live births by birth weight and race: United States and each State, 1954-----	269

Fetal Deaths

Table	Page
29. Fetal deaths by State of occurrence distributed according to State of residence: United States and each State, 1954-----	273
30. Fetal deaths by month and race: United States and each State, 1954-----	276
31. Fetal deaths by age of mother and race for the United States and each State; and by sex for the United States: 1954-----	278
32. Fetal deaths by attendant, gestation group, and race: United States and each State, 1954-----	282
33. Fetal deaths by birth weight and race: United States and each State, 1954-----	285
34. Fetal deaths by period of gestation and race for the United States and each State; and by sex for the United States: 1954-----	288

Infant Deaths

35. Deaths under 1 year, by detailed age, race, and sex: United States and each State, 1954-----	292
36. Deaths under 1 year and under 28 days, by month and race for the United States and each State; and by detailed age and sex for the United States: 1954-----	308
37. Deaths under 1 year, under 28 days, and 28 days to 11 months, from 45 selected causes by month: United States, 1954-----	315
38. Deaths under 1 year and under 28 days, from 45 selected causes, by race, for urban and rural areas in metropolitan and nonmetropolitan counties: United States, 1954-----	318
39. Deaths under 1 year from 45 selected causes, by detailed age, race, and sex: United States, 1954-----	324
40. Deaths under 1 year, under 28 days, and 28 days to 11 months, from 45 selected causes, by race: United States and each State, 1954-----	342

Volume II**Total Deaths (Exclusive of fetal deaths)**

41. Deaths by State of occurrence distributed according to State of residence: United States and each State, 1954-----	2
42. Deaths by month: United States and each State, 1954 (by place of occurrence)-----	5
43. Deaths by month, race, and sex: United States and each State, 1954-----	6
44. Deaths by specified race and sex: United States and each State, 1954-----	12
45. Deaths by race and sex for metropolitan and nonmetropolitan counties: United States and each State, 1954-----	13
46. Deaths by age for metropolitan and nonmetropolitan counties: United States and each State, 1954-----	15
47. Deaths and death rates for each cause, by race and sex: United States, 1954-----	17
47. Supplement: Deaths from nontransport accidents by race, sex, and place of accident: United States, 1954-----	33
48. Deaths from 256 selected causes, by month: United States, 1954-----	37
49. Deaths from 256 selected causes, by specified race and sex: United States, 1954-----	42
50. Deaths from 256 selected causes, by age, race, and sex: United States, 1954-----	50
51. Deaths from 256 selected causes, by race and sex: United States and each State, 1954-----	96
52A. Deaths from 64 selected causes, by age, race, and sex: United States, 1954-----	164
52B. Deaths from 64 selected causes, by age, race, and sex: Each State, 1954-----	174
53. Deaths from 64 selected causes: United States and each State, 1954 (by place of occurrence)-----	370
54. Deaths from selected causes: United States, each State and county, metropolitan and nonmetropolitan counties, and specified urban places, 1954-----	374
55A. Deaths from specified infective diseases: United States, specified States and counties, 1954-----	496
55B. Deaths from specified infective diseases: Specified urban places in the United States, 1954-----	503

Symbols

Class or item not applicable (3 dots)-----	...
Data not available (3 dashes)-----	---
Quantity is zero, in frequency tables (1 dash)-----	-
Quantity is zero, in rate or percent tables (1 cipher)-----	0
If rate or percent is more than 0, but less than 0.05-----	0.0
If both frequency and population base are zero in rate or percent tables (1 dash)---	-

Vital Statistics of the United States

INTRODUCTION

Vital statistics available for 1951 to 1954 were curtailed from those compiled for 1950, and the intercensal years of the 1940 to 1950 decade. Data on live births for 1951 through 1954 were obtained from 50-percent samples of all certificates filed. The place of occurrence of each vital event in 1951 and 1952 was classified in the customary units, i.e., the individual urban place having in 1950 a population of 10,000 or more, the county, and the State; while for the place of residence, only the county and State were coded. However, classification of births and deaths by place of residence in urban places was resumed for 1953 and 1954.

This section of the 1954 report has been designed to be used in conjunction with Volume I of the "Vital Statistics of the United States, 1950." Rates in this volume are shown primarily for 1954. For a complete time series, and for explanatory notes applying to the years prior to 1951, reference should be made to Volume I of the annual report for 1950.

SOURCES OF DATA

Birth, death, and fetal death statistics

All live birth, death, and fetal death tabulations for 1954, with the exception noted in the next paragraph, are based on information from transcripts or microfilm copies of the original certificates. These copies were received from the registration offices of all States, certain cities, the District of Columbia, and Alaska, Hawaii, Puerto Rico, and the Virgin Islands. The statistical information on these records was edited, classified, placed on punch cards, and tabulated in the National Office of Vital Statistics.

The 1954 live birth statistics for Delaware, Illinois, Louisiana, Michigan, Mississippi, Oregon, South Carolina, West Virginia, Baltimore City, New York City, and the Territory of Hawaii were produced by a somewhat different procedure. The State vital statistics offices coded the information on their certificates according to the rules followed in the National Office of Vital Statistics. From the punch cards prepared for their own use, the State offices reproduced the information required for national tabulations on punch card forms supplied by the National Office. The reproduced punch cards were verified in the National Office by reference to microfilm copies of the original certificates and were then tabulated with the cards prepared for all of the other States.

A similar procedure was followed in the case of punched cards for 1954 deaths supplied by the California and Oregon State vital statistics offices.

The statistics in this report cover only events occurring within the reporting areas. Deaths of, and births to, American nationals that occurred in other parts of the world are excluded. Events occurring to foreign nationals within the United States are included.

Marriage and divorce statistics

Marriage statistics for the United States are based on reports from State registration offices, local officials, the District of Columbia, and Alaska, Hawaii, Puerto Rico, and the Virgin Islands. For States or areas for which numbers of marriages are not available, numbers of marriage licenses are used as the nearest approximations to marriages. Marriage statistics on personal characteristics are based on tabulations received from the registration offices of those States which maintain central registers of marriages.

Divorce statistics for the United States are based on reports from those State registration offices which maintain central registers of divorces, from other sources in a few additional States, from the District of Columbia, and from Alaska, Hawaii, Puerto Rico, and the Virgin Islands. The number of reports received in the National Office of Vital Statistics varies from year to year. National totals are estimated.¹ Whenever reported, annulments are included in State figures.²

Notifiable disease statistics

Tabulations of notifiable diseases are limited to the number of cases of certain infectious diseases which are reported to the Public Health Service by the State departments of health.

Standard certificates

Standard Certificates of Live Birth, Death, and Fetal Death (Stillbirth), issued by the National Office of Vital Statistics, serve as the principal means for gaining uniformity in the content of the documents used to collect information on these events. They are modified in each State to the extent made necessary by the particular needs of the State or by special provisions of the State vital statistics law. However, the certificates of most States conform closely, in content and arrangement, to the standard certificates.

The first issues of the Standard Certificates of Birth and Death appeared shortly before the formation of the registration areas. Since then, they have been revised periodically by the national vital statistics agency, in consultation with State health officers and registrars; Federal agencies concerned with vital statistics; national, State, and county

¹For an explanation of the methods used in estimating national and State figures, see "Marriages and Divorces: Each State and Territory, and Specified Possessions, 1953," National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 42, No. 3, p. 50, 1955.

¹The title of this certificate is being shown as it appeared on the 1949 revision of the standard certificate. More recently, however, there has been a change in terminology from "stillbirth" to "fetal death" in conformity with the recommendations of the Third World Health Assembly (May 1950). Future changes in the standard certificate will reflect the new terminology.

medical societies; and others working in the fields of public health, social welfare, demography, and insurance. This revision procedure has assured careful evaluation of each item in terms of its current and future usefulness for registration, identification, legal, medical, and research purposes. New items have been added when necessary, and old items have been modified to ensure better reporting or in some cases dropped when their usefulness appeared to be limited.

Standard certificates of live birth, death, and fetal death recommended to the States for adoption starting with 1949 are shown in figures 2, 3, and 4. The format of all three certificates was changed to a block-type design to provide more space for making entries on the certificates than did the previous design and to make the certificates readily adaptable to typewriter usage—a factor of increased importance in view of the marked rise in the proportions of births and deaths occurring in hospitals and institutions.

CLASSIFICATION OF DATA

The principal value of vital statistics data depends upon the computation of rates in which the vital events of a class are related to the population of a similarly defined class. Vital statistics and population statistics must, therefore, be classified according to similarly defined systems and tabulated in comparable groups. Even when the variables common to both, such as geographic area, age, race, and sex, have been similarly classified and tabulated, differences between the enumeration method of obtaining population data and the registration method of obtaining vital statistics data may result in significant discrepancies.

The classification of certain important items is discussed in this section.³

Geographic classification

The geographic code⁴ used in the tabulation of live birth, death, and fetal death data gives a separate identifying number to each city having, in 1950, a population of 10,000 or more, and to certain towns, townships, and districts which under special rules are classified as urban.

The places classified as urban under special rules are of two types. One type is limited to the States of New Hampshire, Massachusetts, and Rhode Island. It is made up of towns (townships) in which there is a village or thickly settled area having 2,500 inhabitants or more and comprising, either by itself or when combined with other villages within the same town, more than 50 percent of the total population of the town. In this report, only those towns of this type having 10,000 inhabitants or more are shown. A second type is made up of townships and other political subdivisions (not incorporated as municipalities, nor containing areas so incorporated) with a total population of 10,000 or more and a population density of 1,000 or more per square mile.

The geographic code also gives a separate number to each county. Although villages and cities having populations of less than 10,000 are not individually identified, urban places of 2,500 to 10,000 as a group and the remainder of the

county (places under 2,500 and rural area) are tabulated separately. The classification of urban places used in tabulations for 1954 was based on their populations enumerated in the 1950 census.

The growth of the urban fringe during the last decade has increased the need for an area classification that can discriminate adequately between the population living in, and served by the facilities of, large urban centers, and the population of more isolated areas. The States have been divided into metropolitan and nonmetropolitan counties, the division being based on the "standard metropolitan area" definition established by the Federal Committee on Standard Metropolitan Areas.⁵

A county is classified as "metropolitan" or "nonmetropolitan" depending on whether it is included or excluded from the standard metropolitan areas developed by the Bureau of the Census in cooperation with other Federal agencies. Except in New England, a county is included in a standard metropolitan area, if it contains at least one city of 50,000 population or more in the 1950 census, or if it is contiguous to a metropolitan county, is essentially metropolitan in character, and its population is socially and economically integrated with the central city or cities of the area, according to specified criteria.

In New England, the towns and cities, rather than the counties, are the units used to define the standard metropolitan area. However, since vital statistics are not tabulated by town in this Office, all counties with more than half their population in standard metropolitan areas are classified as "metropolitan."⁶ The counties classified as metropolitan are shown in table A.

Massachusetts data

Errors in the transcription of birth and death certificates in the Massachusetts State office made it undesirable to tabulate data by place of residence for the individual urban places and counties in that State. Figures for 1954 are shown only for the State as a whole. Estimates of the numbers of births and deaths in urban and rural areas, and in metropolitan and nonmetropolitan counties of Massachusetts were included in the total for the United States in these categories.

Age

Very little direct evidence of the accuracy of age information on vital records is available. Some sources of error in the age data are apparent. A small number of vital records are filed with age not reported, and some vital events are not registered. Measures of the variation of completeness of registration with age are available only for "age of mother" and "age of father" for live births. These figures were derived from nationwide tests of birth registration completeness and have been shown in a previous report.⁷ For deaths, in the absence of quantitative measures, it has

³The complete rules followed in the classification of geographic and personal items for births and deaths are set forth in a printed manual, "Vital Statistics Instruction Manual, Part I, Coding and Punching Geographic and Personal Particulars of Births, Deaths, and Fetal Deaths (Stillbirths) Occurring in 1954," Washington, D. C., 1955.

⁴National Office of Vital Statistics, "Vital Statistics Instruction Manual, Part IV, Geographic Code," geographic classification used in coding and tabulating vital statistics data, April 1952.

⁵For a more complete discussion of these areas, see "United States Census of Population: 1950, Volume II, Characteristics of the Population," Part 1, United States Summary, pp. 27-31, U. S. Bureau of the Census, U. S. Government Printing Office, Washington, D. C., 1953.

⁶This classification corresponds to State economic areas in New England. See "State Economic Areas," Bogue, Donald J., U. S. Bureau of the Census, 1951.

⁷See "Vital Statistics of the United States, 1950, Volume I," chapter 6. In the computation of rates, errors arising in the population base through underenumeration at particular ages are also of importance. These errors have been described in the "United States Census of Population, 1950," Volume II.

been assumed for some purposes that for the United States as a whole, the registration of deaths under 1 year is incomplete to the same extent as births; while at other ages, all deaths are registered. The exact amount of error in these assumptions is unknown.

Misstatement of age, another type of error on vital records, has been evaluated for the most part on the basis of internal consistency of the data in any one year, or from year to year. There is some evidence of overstatement at certain ages, such as age 18 for brides, age 21 for grooms, and age 30 for mothers. There is also evidence of overstatement of age on the death certificates of persons reported as 65-69 years and at the oldest ages, particularly for nonwhites, which is sufficiently frequent to affect seriously death rates at these ages.⁸

At ages 85 years and over, reported ages seem to be subject to particularly large errors. Since exaggeration of age is apparently greater in the enumerated population than on the death certificate, it has been suggested that death

rates be based on the "method of extinct generations," which makes use only of death statistics.⁹ This method identifies each death with a particular generation determined by the year of birth. The population exposed to death at a certain age within one generation is then equal to the sum of all deaths that occur at or after that age, within the same generation, up to its extinction. The application of this method requires the tabulation of deaths by single years of age, accumulated over a series of years. Table B continues the series of tabulations of these data. The first was published in the report for 1951.

Nativity

Early mortality reports published by the Bureau of the Census contained extensive tables showing nativity of the parents as well as nativity of the decedent, but the publication of these tables was discontinued in 1933. Mortality data showing nativity of decedent were again published in the annual reports for 1939 to 1941, and for 1950, when comparable population figures were available.

In the reports on birth statistics prior to 1937, more emphasis was placed upon country of birth of parents. Detailed tables showing specific country of birth of mother and of father, as well as more abridged classifications, have been published for each year through 1936. These data have been of historical importance in tracing the changing composition of the population of the United States. In recent years, however, the number of births to foreign-born parents has become a relatively small proportion of the total. Accordingly, since 1937, tables on births showing nativity of parents have been abridged.

Race

Births and deaths in the continental United States are classified in detail by white, Negro, American Indian, Chinese, Japanese, and a residual group of numerically minor races. The classification white includes persons reported as Mexican and Puerto Rican. In the Negro group is included a reported mixture of Negro with any other race. Other mixed parentage is classified according to the race of the nonwhite parent and mixtures of nonwhite races to the race of the father.

In some tables an extended classification is not needed and the racial divisions are "White," "Negro," and "Other." In tables where the main purpose is to isolate the major group, the classifications are simply "White" and "Nonwhite."

Marriages are classified by race by the individual States. In this report, they are shown for the "White," "Negro," and "Other" groups, or for the two groups "White" and "Nonwhite."

The correct designation of race is a difficult and complex problem, but classification from vital statistics records into the broad groups used in these volumes is relatively simple. Difficulties may arise in computing rates based on populations classified by race because of differences resulting from the registration and enumeration methods of collecting this information.

The procedures used in completing vital statistics records result, in general, in an entry of race on the certificate that is accepted by the family. Race reported in the Census of Population is recorded on the basis of observation by the enumerator. Serious differences arise for Indians, and for

Table B. DEATHS BY SINGLE YEARS OF AGE, AT AGES 85 YEARS AND OVER, BY RACE AND SEX: UNITED STATES, 1954

⁸For a more detailed discussion, see "Vital Statistics of the United States, 1950, Volume I," chapter 8, p. 161, U. S. Government Printing Office, Washington, D. C.; 1954.

⁹Vincent, Paul, "La Mortalité Des Vieillards," Population, 6^e année, numero 2, Avril-Juin, 1951.

the "other nonwhite" group. In several Southern States, groups of persons of mixed stock of Indian and other races, who for the purpose of reporting vital events consider themselves Indian, have been classified in the 1950 census as other nonwhite.¹⁰ These groups contain about 32,000 persons.¹¹ For the most part, they were enumerated as "Indian" in the 1940 census.

In other areas of the country, where Indians live among the general population, census figures are lower than estimates made by the Bureau of Indian Affairs. The population enumerated as Indian for the entire country numbered 342,226, while the Bureau of Indian Affairs has estimated the 1950 population at 421,600. The latter figure was obtained by adding the natural increase to the Indian population enumerated in 1930 and is subject to the inaccuracies of the source figures. It is obvious that such differences in population estimates will produce large differences in rates.

Observed differences in vital statistics rates for various racial groups should not be interpreted as necessarily due to inherent racial causes. Race is not independent of other factors, and the economic, social, and medical circumstances of one racial group may be quite different from those of another. For example, an observed difference in mortality by race may in actuality be no more than a difference of mortality for different economic classes.

Births in hospitals

Births are classified as occurring in hospitals on the basis of entries on the birth certificates. This classification is unrelated to American Medical Association (AMA) registered hospital listings. In comparing data from the National Office of Vital Statistics with those published by the AMA, it should also be borne in mind that the surveys on which AMA figures are based cover a reporting period from October 1 to September 30, whereas the data of this Office are for the calendar year.

Birth weight

The possibility of obtaining national statistics on birth weight is only a recent development, dating from the 1949 Revision of the Standard Certificates of Live Birth and Fetal Death (Stillbirth). By 1950, the birth certificates in all but one State (Massachusetts)¹² and the fetal death certificates in most States included an item on birth weight, and national tabulations based on this item were prepared for the first time in that year.

Several qualitative factors enter into the consideration of birth weight statistics. Data relating to events occurring in hospitals are unquestionably the most accurate. The lack of means in many cases for weighing babies delivered at home is reflected in a sizable proportion of "not stated" weights for certain groups. In addition, in some instances, particularly among midwives, those who did weigh infants

born at home used fairly crude scales graduated by quarter pounds.

Still another factor is underreporting of infants who die shortly after birth. Many of these infants are small, and therefore their omission would affect the distribution of live births by weight. It is believed that this also is most serious for groups where a significant proportion of the deliveries are attended by nonphysicians.

In practically all areas, birth weight is reported in terms of pounds and ounces rather than in grams. However, the metric system classification has been used in tabulating and presenting the statistics to facilitate comparison with data published by other groups in the United States. The equivalents in pounds and ounces of the gram intervals are given in each table containing weight data.

Although the "not stated" birth weight groups for live births were relatively small for both white and nonwhite races, there is evidence that they were biased in the direction of failures to report weight for small babies. For this reason before computing the percentage distributions of live births by weight shown in this volume, the "not stated" weights were distributed, utilizing information available for 1951 on the bias in reporting.

At the present time birth weight information is much less completely reported for fetal deaths than for live births.

For purposes of classification, the term "immature" is defined as referring to infants weighing 2,500 grams or less at birth. This definition was recommended by the American Academy of Pediatrics in 1935, and later adopted in the Sixth Revision of the International Lists of Diseases and Causes of Death (1948). "Premature," although containing the concept of duration of pregnancy, has also been used for many years in connection with the birth weight criterion. In terms of gestation age, it relates to pregnancies of less than 37 completed weeks. It is recognized that there may be basic differences in physical development for some of the subgroupings of births, which would affect the general applicability of the criteria for classifying births as "immature" or "premature."

Illegitimate births

The following States do not now have a birth record item concerning the legitimacy of the birth: Arizona, Arkansas, California, Colorado, Connecticut, Idaho, Maryland, Massachusetts, Nebraska, New Hampshire, New Mexico, New York, Oklahoma, and Vermont. Estimates for the United States were derived by adding an estimate of the number of illegitimate live births in States for which legitimacy data were not available, to the number of illegitimate live births tabulated for the reporting States. No estimates were included for misstatements on the birth record or for failures to register births. For 1951 to 1954, the estimates are based on a 50-percent sample of live births in the reporting States.

There is no direct knowledge as to the characteristics of the unwed mothers who may be misreporting legitimacy status. It seems likely, however, that the decision to conceal the illegitimacy of the birth is conditioned by attitudes in the mother's social group towards her and towards children born out of wedlock. Also, the ability (economic or otherwise) to leave a community before the birth of the child is an important consideration. These factors are generally believed to operate in the direction of a proportionately greater understatement of illegitimacy in the white race than in the nonwhite and in the older age group of women as compared with the younger. Another source of error is the failure to register births at all. It may well be that under-registration is appreciably greater in the illegitimate group than in the legitimate.

¹¹Beale, Calvin L., "The Enumeration of Mixed-Blood Racial Groups of the Eastern United States in the Census of 1950." Unpublished paper presented at the annual meeting of the Population Association of America, May 1953.

¹²Weight data for live births in Connecticut were recorded in a section of the birth record which was not available for tabulation by the National Office of Vital Statistics for 1950 through 1954.

Gestation period

Information on length of gestation as given on the vital record has been seriously deficient. The comparatively large proportions at 36 weeks of gestation resulted principally from the erroneous conversion of 9-month gestations to 36 weeks. This type of error was also present at earlier gestations although the broad intervals into which the data are grouped reduce its effect. In addition, the heavy concentrations at 40 weeks are indicative, in part, of a failure to calculate period of gestation for the newborn infants or fetuses of normal size. Although the main result of this is to lessen the numbers in the adjacent gestation intervals, some understatement of gestations of less than 36 weeks may also occur as a consequence. In view of the major distortion in the data for 36 weeks, the tables in this volume (tables C, 32, and 34) show statistics for this gestation age separately.

Fetal deaths

The minimum gestation age for which the registration of a fetal death was called for in 1954 is given in table C for each State. It will be noted that by the end of 1954 in only one area (Rhode Island) was the lower limit for reporting fetal deaths above 20 weeks (or 5 months). In contrast, there were seven areas (Colorado, Georgia, Mississippi, Oregon, South Dakota, Vermont, and New York City) requiring the registration of all fetal deaths regardless of gestation age. All except two of the remaining areas specified the minimum period as 20 weeks (or 5 months). For these areas there were variations in terminology which may also have given rise to some differences in interpretation and reporting.

Another aspect in which the State registration requirements for fetal deaths have differed is in the specification of the criteria for determining the absence of life at time of birth. In most areas, requirements in 1954 specified that any one of the following criteria—heart action, breathing, and movement of voluntary muscles—was evidence of life. The regulations of a third of the areas, however, were not specific but merely identified fetal death as “not a live birth” or “showing no evidence of life.”

While differences in regulations have caused a large degree of incomparability in the past, it is believed that, at the present time, underregistration is of far greater significance. A measure of underreporting of fetal deaths is available only for New York City.¹³ In this area, where reporting of fetal deaths, for the period of the test, 1943 through 1945, was probably more complete than in the rest of the country in 1954, it was found that 14 percent of the fetal deaths occurring in the “third trimester of pregnancy” were not registered.

An effect, counter to that of underreporting, probably exists in some areas because of the reporting of some live-born children who die almost immediately after birth as fetal deaths. The perinatal rate, which is frequently based on fetal deaths of gestations of 20 or 28 weeks or more and early neonatal deaths combined, has been used in some investigations to overcome the effect of this factor.

Periodically, over the past 15 to 20 years, considera-

tion has been given to methods for improving comparability of fetal death statistics. However, the most concerted action started in 1950. In an effort to introduce consistency in terminology and at the same time to stimulate the collection of data on total fetal loss, the World Health Organization in May 1950 recommended for adoption the following definition of fetal death: “Fetal death is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.¹⁴ The term “fetal death” was defined on an all-inclusive basis to end confusion arising from the variety of usages of such terms as stillbirth, abortion, miscarriage, etc.

The definition of fetal death issued by the World Health Organization has been adopted in the United States as the nationally recommended standard for use in State and municipal registration laws and regulations.¹⁵ As a further step toward increasing the comparability of data on fetal deaths for different countries, the World Health Organization recommended that in classifying fetal deaths for statistical purposes they be grouped as early, intermediate, and late fetal deaths. These groups are defined as follows:

Less than 20 completed weeks of gestation (early fetal deaths)-----	Group I
20 completed weeks of gestation but less than 28 (intermediate fetal deaths) ----	Group II
28 completed weeks of gestation and over (late fetal deaths) -----	Group III
Gestation period not classifiable in Groups I, II, and III -----	Group IV

Fetal deaths of less than 20 weeks of gestation have been excluded in preparing most of the tables in this volume in order to obtain data on a consistent basis for comparison from year to year and from State to State. Fetal deaths of unknown gestation, however, are included in these tables since it is reasonable to assume that very few relate to fetal deaths of gestations of less than 20 weeks.¹⁶ Data on this basis (that is, including only those fetal deaths for which the period of gestation was stated to be 20 weeks or more, or was not stated) were first shown in publications relating to fetal deaths for 1945. Limited information for this group is also available for 1942 to 1944.

¹⁴Public Health Service, National Office of Vital Statistics, “International Recommendations on Definitions of Live Birth and Fetal Death,” PHS Publication No. 39, Washington, D. C., October 1950.

¹⁵Prior to the adoption of this definition the nationally recommended definition of a fetal death (stillbirth) for registration purposes was as follows: “A fetus showing no evidence of life after complete birth (no action of heart, breathing, or movement of voluntary muscle), if the 20th week of gestation has been reached, should be registered as a stillbirth.”

¹⁶Exceptions are the seven areas requiring registration of all fetal deaths regardless of gestation period. In these areas, a considerable proportion of the not stated group probably relate to fetal deaths of gestations of less than 20 weeks. Inclusion of the not stated group, therefore, tends to overstate fetal mortality for these areas in relation to other areas.

¹Period of gestation reported in months allocated to gestation intervals in weeks as follows: 1-3 months to "Under 16 weeks"; 4 months to "16-19 weeks"; 5 months to "20-23 weeks"; 6 months to "24-27 weeks"; 7 months to "28-31 weeks"; 8 months to "32-35 weeks"; 9 months to "40 weeks"; 10 months to "43 weeks and over."

²Under 16 weeks of gestation distributed as follows: Under 4 weeks, 8; 4-7 weeks, 179; 8-11 weeks, 501; 12-15 weeks, 296.

³Under 16 weeks of gestation distributed as follows: Under 4 weeks, 12; 4-7 weeks, 235; 8-11 weeks, 627; 12-15 weeks, 505.

⁴Further specified that at 20 weeks, "fetus averages 10 inches in length, and 9 ounces in weight."

⁵Under 16 weeks of gestation distributed as follows: Under 4 weeks, 3; 4-7 weeks, 108; 8-11 weeks, 267; 12-15 weeks, 261.

⁶Under 16 weeks of gestation distributed as follows: Under 4 weeks, 98; 4-7 weeks, 2,615; 8-11 weeks, 7,616; 12-15 weeks, 3,857.

⁷Fetal death certificate used in this State required the reporting of period of gestation in months.

⁸Under 16 weeks of gestation distributed as follows: Under 4 weeks, 4; 4-7 weeks, 91; 8-11 weeks, 230; 12-15 weeks, 183.

⁹Under 16 weeks of gestation distributed as follows: Under 4 weeks, 2; 4-7 weeks, 101; 8-11 weeks, 297; 12-15 weeks, 193.

¹⁰Under 16 weeks of gestation distributed as follows: 4-7 weeks, 7; 8-11 weeks, 27; 12-15 weeks, 33.

¹¹Also includes "or total length of 10 inches."

Cause of death

The Sixth Revision.—Beginning with 1949, the data in the mortality reports published by the National Office of Vital Statistics are tabulated according to the numbers and titles of the International Statistical Classification of Diseases, Injuries, and Causes of Death. The International Lists, in use in this country since 1900, have been revised decennially in order that the terminology by which deaths are classified may be consistent with advances in medical science and changes in diagnostic practice. The classification used since 1949 is the Sixth Revision of the International Lists of Diseases and Causes of Death, adopted by the World Health Assembly in July 1948.¹⁷

The "Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death" includes special lists of causes recommended for mortality tabulations. These are: the Detailed List, consisting of all three-digit categories; List A, the Intermediate List of 150 Causes for Tabulation of Morbidity and Mortality; and List B, the Abbreviated List of 50 Causes for Tabulation of Mortality. Each of these lists has been adapted to serve the needs for mortality data in the United States. The extensions of the lists, however, have been designed so that the original groups can be obtained by a simple addition of titles.

Complete titles and official list numbers are given in tables 47, 49, and 52A in Volume II. Table 47 shows each three-digit category to which a death was assigned in the United States in 1954, and selected four-digit subcategories. The extension of List A, which is used in mortality reports prepared by the National Office, is shown in table 49; and the expansion of List B in table 52A. In other tables using the same lists, it was necessary because of space limitations to abbreviate some cause-of-death titles.

Selection of cause of death.—A large proportion of the death certificates filed annually in the United States report two or more diseases or conditions as causes of death. General statistical practice requires that cases involving more than one cause of death be charged to a single cause, and it is necessary to employ a selection process to determine the one cause to be assigned. The method of selection used has an important effect upon the resulting statistics.

In 1948, the World Health Assembly adopted, along with the Sixth Revision of the International Lists, a form of medical certification and rules for classification of the underlying cause of death to be used internationally. The form of medical certification is shown in the Standard Certificate of Death (figure 3).

It is designed to elicit information which will facilitate the selection of the underlying cause of death when two or more causes are jointly recorded. If the certification is completed properly, the underlying cause of death indicated by the physician is the cause used in the tabulation. This procedure, used in the United States beginning with deaths in 1949, differs sharply from that used in previous years. Formerly, definite priority relationships were set up for combinations of causes reported on the death certificate. The single cause to be tabulated was chosen according to these fixed rules.

Effect of the decennial list revisions.—Each decennial revision of the International List has produced some break in comparability of cause-of-death statistics. For the most part, the degree of discontinuity in the trend has not been considered a problem of great concern. Van Buren¹⁸ de-

scribed some of the major shifts in the cause-of-death statistics up to the 1938 Revision due to changes in the classification of cause of death. In connection with the Fifth (1938) Revision of the International List of Causes of Death, Dunn and Shackley¹⁹ measured the change in mortality by cause due to the revision. This was done by coding mortality data for 1940 by the 1929 and 1938 Revisions. The results of the study have been useful in evaluating the effects of the Fifth Revision of the International List and changes in the joint-cause selection procedure.

The Sixth Revision represents a more sweeping change than any of the previous revisions. In order to make it possible to compute a comparable time series of mortality rates by cause, the International Conference for the Sixth Revision of the International Lists recommended that deaths for a country as a whole in the year 1949 or 1950 should be coded according to both the Sixth Revision and the Fifth Revision. In the United States, 1950 deaths are being used for dual coding. Until data for deaths in 1950 coded by both revisions become available, provisional comparability ratios obtained from a 10-percent sample of deaths in 1949 and 1950 will be used. These ratios, and a series of comparable death rates for 1939 to 1948 are shown in an earlier report.²⁰

Coding in 1954.—While no major changes in classification are made between International List revisions, problems in cause-of-death coding frequently arise in the interim period. The World Health Center for Classification of Diseases was established in January 1950 to ensure, among other things, uniform interpretations of these cases.

The National Office of Vital Statistics prepares annually for its cause-of-death coding clerks an Instruction Manual²¹ which contains decisions and interpretations that will apply in that year. Most of the changes serve to clarify existing rules; a few of them may affect the number of deaths assigned to particular causes.

Decisions producing changes in data for 1950 through 1953 have been discussed in the Introduction to this volume for those years. No changes in coding rules were introduced for 1954. The same edition of the Instruction Manual (issued February 1954) was used to code deaths in 1954 as in 1953.

Medical certification.—The use of a standard classification list, although essential for State, regional, and international comparisons, does not assure strict comparability of the tabulated figures. A high degree of comparability could be attained only if all of the data on cause of death were reported with equal accuracy and completeness. Since the medical certification of death can be made only by a qualified person, usually a physician or a coroner, the reliability and accuracy of cause-of-death statistics are, to a large extent, governed by the acumen and ability of the medical attendant to make the proper diagnosis and by the care with which the death certificate is filled out.

The quality of the basic data reported on the death certificate is, of course, of fundamental importance in the interpretation of cause-of-death statistics. Although a number of notable studies have been made of the accuracy of medical diagnoses, there is an unfortunate lack of national statistics on the subject. All of these investigations are

¹⁷For a history and description of the Sixth Revision, see "Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death," Volume I, World Health Organization, Geneva, Switzerland, 1948.

²⁰See "The Effect of the Sixth Revision of the International Lists of Diseases and Causes of Death Upon Comparability of Mortality Trends," National Office of Vital Statistics, Vital Statistics—Special Reports, vol. 36, No. 10, 1951; and "Vital Statistics of the United States, 1950, Volume I," chapter 2, 1954.

²¹National Office of Vital Statistics, "Vital Statistics Instruction Manual, Part II, Cause-of-Death Coding, 1954," Washington, D. C., 1954.

extremely limited in scope since they are based upon comparison of autopsy and clinical records in certain hospitals and pertain only to those cases that came up for post-mortem examinations. Despite the paucity of data regarding the accuracy of certification of death, the cause-of-death information given on the death certificate is, for the most part, probably fairly reliable.

One index of the quality of cause-of-death statistics is the proportion of death certificates coded to the Sixth Revision category numbers 780-793 and 795, which are the rubrics for ill-defined and unknown causes of death. This percentage indicates the care and consideration given to the certification of cause of death by the attending physician. It may also be used as a rough measure of the specificity of the medical diagnoses made by the physicians in the various areas. In 1954, only 1.4 percent of all reported deaths in the United States were assigned to ill-defined or unknown causes. However, this percentage varies among the States from 0.1 to 9.8 percent, reflecting differences in the quality of reporting.

Control of errors

For many years the assignment of codes for the items to be classified and tabulated from copies of the birth, death, and fetal death certificates, as well as the preparation of punched cards, was verified completely. Review of these verifying procedures in 1947 and of the amount of error which was eliminated by them clearly showed that relatively little was gained for the effort involved. Therefore, beginning with the data for 1947, varying portions of the coding and punching have been verified on a sample basis.

The coding and punching of birth data were performed simultaneously and the major portion of the work verified using a partial sequential sample. This procedure was used in verifying the work of employees whose performance (as indicated by complete verification) was such as to produce consistently less than 4 percent error distributed among all the items. For any one item, less than 1 percent error would be expected under these procedures. The sample procedure coupled with certain mechanical checks of the punched cards achieved an average error level of 2.2 percent for the operation. The procedure involved the verification of the coding and punching of every 10th card throughout each lot of 2,000 cards. If the 4 percent level of error (8 cards containing one or more incorrectly coded or punched columns) was reached, each succeeding card in the lot was verified. In such lots no review was made of that portion preceding the 8th error card. The work of employees (trainees) whose performance was such as to produce more than 4 percent error was verified completely. Errors determined in either procedure were reviewed to detect and control bias.

Coding of all items for deaths was verified in the same manner and according to the same tolerance levels as described above for births. Death data were coded in two separate operations (one entirely devoted to the classification of the underlying cause of death), and then key punched. The procedure for verifying the determination and coding of deaths achieved average error levels of 1.8 percent in cause-of-death coding and 1.7 percent in the combined coding and punching of the other mortality items. As with the punched cards for births, certain mechanical checks, designed to assure compatibility of the items, further reduced the error introduced in the coding and punching operations.

The coding and simultaneous punching of the fetal deaths, because of their relatively small number, were completely verified.

Tabulating, computing, table preparation, and all other operations subsequent to the preparation of punched cards were verified according to procedures designed to eliminate all processing errors.

INTERPRETATION OF DATA

While vital statistics data are useful for a variety of administrative and scientific purposes, they cannot be correctly interpreted unless various qualifying factors, in addition to methods of classification, are taken into account. The factors to be considered depend upon the specific purposes for which the data are to be used. It is not feasible to discuss all of the pertinent factors in the use of vital statistics tabulations, but some of the more important should be mentioned.

Most of the factors limiting the use of the data arise from imperfections in the original records or from the impracticability of tabulating these data in very detailed categories. These defects should not be ignored, but their existence does not vitiate the value of the data for most general purposes. Analysis of small differences or exact evaluation of vital statistics requires careful study of many related elements. However, the major trends and differences will not usually be changed materially by finer analysis.

Small frequencies

The numbers of births or deaths reported for a community, or the numbers of illnesses, marriages, or divorces, represent complete counts of such events.²² As such, they are not subject to sampling error, although they are subject to errors in the registration process. However, when the figures are used for analytical purposes, such as the comparison of rates over a time period, or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have arisen under the same circumstances. The probable range of values may be estimated from the actual figures according to certain statistical assumptions.

In general, distributions of vital events may be assumed to follow the binomial distribution. Estimates of standard error and tests of significance under this assumption are described in most standard statistics texts. When the number of events is large, the standard error, expressed as a percent of the number or rate, is usually small.

When the number of events is small (perhaps less than 100) and the probability of such an event is small, considerable caution must be observed in interpreting the conditions described by the figures. Events of rare nature may be assumed to follow a Poisson probability distribution. For this distribution, a simple approximation may be used to estimate the error, as follows:

If N is the number of births,²³ deaths, or other vital events, R is the corresponding rate, the chances are 19 in 20 that

1. The "true" number of events lies between

$$N - 2\sqrt{N} \text{ and } N + 2\sqrt{N}$$

2. The "true" rate lies between

$$R - 2\frac{R}{\sqrt{N}} \text{ and } R + 2\frac{R}{\sqrt{N}}$$

If the rate R corresponding to N events is compared with the

²²Exceptions to this are birth data for 1951 to 1954. As discussed later, these statistics are based on a 50-percent sample of the birth records, and therefore they vary from complete counts.

²³Data for births in 1954 are derived from a 50-percent sample, and N should therefore be taken as one-half of the number of births given in the tables of this volume.

rate S corresponding to H events, the difference between the two rates may be regarded as statistically significant, if it exceeds

$$2\sqrt{\frac{R^2}{H} + \frac{S^2}{H}}$$

For example, suppose that the observed death rate for Community A was 10.0 per 1,000 population and that this rate was based on 20 recorded deaths. Given prevailing conditions, the chances are 19 in 20 that the "true" or underlying death rate for that community lies between 5.5 and 14.5 per 1,000 population. Let it be further supposed that the death rate for Community A of 10.0 per 1,000 population were being compared with a rate of 20.0 per 1,000 population for Community B which is based on 10 recorded deaths. While the difference between the rates for the two communities is 10.0, this difference is less than twice the standard error of the difference

$$2\sqrt{\frac{(10.0)^2}{20} + \frac{(20.0)^2}{10}}$$

of the two rates which is computed to be 13.4. From this, it is concluded that the difference between the rates for the two communities is not statistically significant.

Sampling of birth records

Final natality data for 1954, as well as for 1951 through 1953, have been derived from a 50-percent sample, which consists of only the even-numbered live birth records.²⁴ Statistics for the year were obtained by multiplying the sample figures by two. Prior to 1951, the annual birth statistics were based on the total file of birth records.

The data for these 4 years differ from figures that would have been derived by processing all of the records. However, the manner in which records are numbered greatly reduces the sampling variability of totals for geographic areas. With few exceptions, records are numbered in the State offices of vital statistics as they are received from the local offices.²⁵ The assignment of the last digit in the number is not selective, and the systematic sample of even-numbered records may be assumed to be unbiased. Furthermore, because the records are almost always in geographic order before numbering, twice the sample count of births occurring in the great majority of the urban places and counties in table 18 is virtually the same as the corresponding figure based on all records.

This was confirmed by a comparison of the inflated sample figures for 1951 with actual counts of the total numbers of records filed for births that occurred in these areas. In less than one-tenth of the areas was the difference 5 or more. The maximum difference was 12.

The extent to which residence figures for urban places, counties, and States derived from the sample differ from the totals that would have resulted from a complete count depends on the amount of nonresident interchange. (This assumes virtually no error in the figures on a place of occurrence basis.) Since there is relatively little nonresident interchange of births among the States and between "metropolitan" and "nonmetropolitan" groups of counties in any State, the sampling errors for these geographic units are negligible.

The nonresident interchange factor is more important for many individual urban places and counties. During 1954, 45 percent of the births occurred in an urban place or rural part of a county which was not the mother's place of residence. Figures are not shown in this volume on the amount of nonresident interchange in individual urban places or counties. But, the net situation for an area can be determined by comparing the figures by place of occurrence and by place of residence in table 18. The percent error in an urban place or a county resident total due to sampling, varies between zero and the value obtained from the table described below; the amount of the error depending on the extent of nonresident interchange as judged from this comparison.

Table D presents percent errors due to sampling in the published birth data by detailed characteristics. The chances are about 2 out of 3 that the percent difference due to sampling variability between the published figure based on the sample and the result that would be obtained by a complete count is less than the percent error. The chances are about 19 out of 20 that the percent difference is less than twice the percent error.

Table D. SAMPLING ERRORS IN BIRTH STATISTICS: 1954
(Percent error due to sampling variability)

NUMBER OF BIRTHS WITH A SPECIFIED CHARACTERISTIC	TOTAL BIRTHS IN AREA OR TO RESIDENTS OF AREA ¹							
	250	500	1,000	2,000	5,000	10,000	50,000	500,000
30-----	18.3	18.3	18.3	18.3	18.3	18.3	18.3	18.3
50-----	14.1	14.1	14.1	14.1	14.1	14.1	14.1	14.1
100-----	7.7	8.9	9.5	9.7	9.9	9.9	10.0	10.0
250-----	0.0	4.5	5.5	5.9	6.2	6.2	6.3	6.3
500-----	...	0.0	3.2	3.9	4.2	4.4	4.4	4.5
1,000-----	0.0	2.2	2.8	3.0	3.1	3.2
2,000-----	0.0	1.7	2.0	2.2	2.2
5,000-----	0.0	1.0	1.3	1.4
10,000-----	0.0	0.9	1.0
20,000-----	0.5	0.7
50,000-----	0.0	0.4

¹An "area" is the smallest geographic unit to which the figure under consideration pertains. If the area is a city or county of residence where appreciable nonresident interchange occurs, the sampling error will be slightly larger.

²⁴This applies to data for all States, the District of Columbia, Hawaii, and Puerto Rico. Data for Alaska and the Virgin Islands are based on all of the records filed. Another exception to this general statement relates to data for sets of plural births (table 26). Data on sets of twins with one mate born alive are based on a 50-percent sample. All other plural birth data are based on virtually 100 percent of the cases reported. Matching records for mates in plural sets were located to obtain characteristics given.

²⁵For several States, the number used to identify the birth record for sampling was assigned by the National Office of Vital Statistics. These States transmitted transcripts of all the birth records arranged by county and civil subdivision within the county. The transcripts were numbered consecutively by the National Office of Vital Statistics as part of a routine control operation, and even-numbered records were then selected for processing.

Completeness of registration

Although every State has adopted a law requiring the registration of births, deaths, and fetal deaths, these laws are not uniformly observed. In most areas, practically all births and deaths are registered. For some areas, however, there is enough underregistration to affect the use of the statistics for certain purposes.

Nationwide tests of completeness of birth registration were made in both 1940 and 1950. For the United States as a whole, these tests indicated that birth registration was, respectively, 92.5 and 97.9 percent complete. A detailed discussion of the results of these tests was given in chapter 6, "Vital Statistics of the United States, 1950, Volume I."

On the basis of results of the 1950 test, it is estimated that in 1954, birth registration completeness was 98.5 percent for the country as a whole—99.1 for the white race and 95.1 for the nonwhite.

Quantitative information on completeness of death registration is not available. One condition for admission to the national registration areas was a demonstrated registration completeness of at least 90 percent, although the method used in testing completeness was subject to considerable error. On the basis of this criterion, all of the States were admitted to both the birth- and the death-registration areas by 1933. It is believed that in the past death registration for the United States has been more complete than birth registration, although the difference now may be rather small. There is evidence, however, that in certain isolated areas, incomplete registration is still a problem. For example, a study made in a few selected counties of Tennessee where the death rates for 1949 to 1951 were unusually low, served to locate a number of unregistered deaths.²⁶ A similar situation may exist in other States.

Registration of fetal deaths is probably significantly incomplete in all areas. Further discussion of fetal death registration is contained in the section on Fetal deaths.

Central registration of marriages and divorces is not required in all States, and no comprehensive study of the completeness of marriage and divorce registration in the United States has yet been made.

Completeness of reporting of the notifiable diseases varies greatly by disease and by area. In general, reporting is significantly incomplete, but exact information on this subject is not available.

Population bases

Vital rates shown in this report for the United States and the individual States are based on the populations present in the respective areas. These populations exclude the armed forces and civilian personnel overseas, but include the armed forces stationed in each area. (On July 1, 1954, it was estimated that there were 1,226,000 persons in the armed forces overseas, or 0.8 percent of the total population.) The estimates of the total population of the United States by age, race, and sex in 1954, are shown in tables I and J.²⁷ They are based on data from the 1950 census, and statistics of births, deaths, immigration, and emigration since April 1, 1950. Estimates of the population in each State in 1954 (table K)²⁸ are based on the civilian population enumerated in the 1950 census, estimates of births, deaths, net civilian migration, movement into the armed forces, and data on State of preservice residence of persons in the armed forces.

Since publication of the 1953 report, the Bureau of the

²⁶Tennessee Department of Public Health, "Results of Survey of Death Registration Completeness," *The Spotlight*, January 1954.

²⁷U. S. Bureau of the Census, "Estimates of the Population of the United States, By Age, Color, and Sex: July 1, 1950 to 1955," *Current Population Reports*, Series P-25, No. 121, 1955.

²⁸U. S. Bureau of the Census, "Estimates of the Population of Continental United States, by Regions, Divisions, and States, and of Alaska, Hawaii, Puerto Rico, the Canal Zone, and the Virgin Islands: July 1, 1950 to 1954," *Current Population Reports*, Series P-25, No. 124, 1955.

Census has issued revised State population estimates for the years 1951 to 1953. Consequently, all vital rates for individual States for these years have been recomputed in this report.

One new population table and a corresponding table of mortality rates for 1954, giving data by broad age-groups for individual States have been included.

All population estimates used in this report were prepared by the United States Bureau of the Census.

Life table statistics

The rates of mortality during a specific period may be summarized by the life table method to obtain measures of comparative longevity. Tables AK and AL are the 1954 abridged life tables for the total population and by race and sex. They are preceded by an explanation of the columns of the life table. The death statistics used in calculating the mortality rates in 1954 abridged life tables were obtained from the regular tabulations of the National Office of Vital Statistics and include only deaths occurring in the continental United States. The estimates of the population on July 1, 1954, were obtained from the Bureau of the Census²⁹ and exclude the estimated number of persons in the armed forces overseas.

Residence statistics

Official national birth and death statistics and those published by most State and city agencies were once compiled only according to place of birth and place of death. Under this system of tabulation, the data were tabulated by the urban place, county, or State in which the birth or death occurred, irrespective of the usual place of residence of the mother of the child, or the usual place of residence of the decedent.

The difficulties involved in interpreting data obtained by this method of tabulation can be understood by considering the effect of movement of people on death rates. For example, the hospital facilities in an area may attract patients from surrounding areas and, as a result, some of the deaths occurring in an area will not be deaths of residents of this area. The enumerated or estimated population of the area does not, under such conditions, represent the number of persons exposed to the risk of death; and the death rate does not accurately describe the mortality conditions of this particular area. A more correct figure is obtained by re-locating all deaths to the place of residence.

Similar nonresident factors affect the interpretation of birth statistics based upon place of occurrence. In order to determine the direction or the magnitude of the differences between rates based on births or deaths according to place of occurrence and those compiled according to place of residence, it is necessary to examine tabulations on both bases.

Data given in these volumes are tabulated according to place of occurrence and place of residence, with much greater emphasis upon the latter. Figures for individual urban places and counties or for population groups by place of occurrence do not give an accurate indication of relative health and fertility conditions. However, for a larger area such as a State, the tabulations compiled on the two bases do not usually show a substantial difference. The tabulations

²⁹Same as footnote 27.

by place of occurrence and by place of residence are identical for the total United States, because births and deaths of United States residents occurring outside of the country and of foreign residents occurring in the country are not reallocated to the country of residence.

Tests made in 1950 indicate that for the country as a whole, errors in residence reporting result in a significant overstatement of births to residents of urban places, and a corresponding understatement in the number to residents of areas classified as rural. The extent of bias varies from State to State. Residence errors occur largely because of the major growth in population areas close to cities. Frequently, parts of these surrounding areas have city mailing addresses, and unless special care is taken in asking for residence information, they could be identified as being inside the cities. This situation has assumed special importance because of a concomitant development, the increased utilization of hospitals in cities by residents of nearby places. Misstatements of residence are more likely to remain undetected in such cases than when the birth occurs in the place of residence.

Corresponding measures of the accuracy of residence reporting on death records are not available; however, it is believed that the foregoing qualifications would also generally apply to resident death statistics. A more detailed discussion of residence reporting error is presented in "Vital Statistics of the United States, 1950, Volume I."

Most of the tabulations on marriages and divorces provided by the individual States are classified by place where the event occurred. It is not possible at the present time to allocate these data to place of residence.

The practice of allocating notifiable diseases by residence varies not only with respect to diseases but also among the States. Corrections usually are not made for diseases of high frequency such as Measles and Whooping cough. In some States, an attempt is made to allocate by residence cases of Typhoid fever, Poliomyelitis, Diphtheria, Smallpox, and certain other diseases, but this practice is not uniform.

Nativity.—A birth in 1954 is classified as "nonresident" if it did not occur in the urban place or rural part of the county in which the mother usually resides. Of the 4,017,362 live births registered in the United States in 1954, 45 percent were in this category. Many of the nonresident births undoubtedly were to mothers who lived in the rural area of one county and had their babies delivered in hospitals of a city in another county. Only a small percentage of mothers who gave birth elsewhere than in their usual residence crossed State lines.

A summary of births in 1954 by place of occurrence and by place of residence is given for each State in table E. The type of data just described for the United States as a whole can be obtained for individual States from this table. In addition, the table indicates the gross movement into a State by residents of all of the other States combined, and the comparable movement out of the State. Information concerning the amount of movement between specific States is found in table 20.

A comparison between the occurrence and residence totals of births is shown for individual States in the table. Excluding the District of Columbia, three States—Maryland, Rhode Island, and Virginia—had the largest differences. For two of these States (Maryland and Virginia), the occurrence figures were below the residence by 6.0 and 4.8 percent, respectively. For Rhode Island, the occurrence total

exceeded the residence total by 6.4 percent.

Mortality.—A death in 1954 is classified as "nonresident" if the information on the death certificate indicated that it did not occur in the urban place or rural part of the county in which the decedent had usually resided. Of the 1,481,091 deaths registered in the continental United States in 1954, 30 percent were nonresident (table F). About 9 in 10 of the nonresident deaths occurred in the State of residence.

A summary of deaths in 1954 by place of occurrence and by place of residence is given for each State in table F. The total amount of intrastate and interstate movement for individual States is given. Also, the table indicates for each State the number of residents of all the other States who died there, and the reverse situation. Table 41, Volume II, contains more detailed information on the interstate movement.

In most cases, the number of residents of other States who die in a State is approximately balanced by the reverse type of movement. There are a few exceptions. In Nevada, the recorded death total for 1954 exceeded the resident figure by 10.0 percent and the comparable excesses (excluding the District of Columbia) for Arizona, Florida, and Delaware were 5.9, 4.5, and 3.9 percent, respectively. While relatively unimportant in the statistics for most States, re-allocating interstate nonresident deaths has a major effect on the data for certain communities lying close to State borders.

Marriages.—Numbers and percentage distributions of marriages classified according to whether either the bride or the groom, or both, or neither, resided in the State where the marriage occurred are shown in table G for 27 States for 1954. This table is a compilation of all available data on the subject. It is not necessarily representative of the United States as a whole.

The data reveal the importance and need of tabulations by place of residence. Of the 650,875 marriages recorded in 1954 in the 27 specified States, 144,240 or 22.2 percent, occurred in a State where neither party resided. In Mississippi, nonresident couples constituted 59.3 percent of the total number married in the State during 1954; in South Carolina, 53.2 percent, and in Maryland, 47.3 percent. North Dakota was at the other extreme with a negligible number of marriages between nonresidents (0.2 percent). The percentages of marriages where only one of the parties was a nonresident ranged from 18.5 percent in Vermont to 5.4 percent in Michigan. In each instance, marriages of resident brides and nonresident grooms were more numerous than the reverse combination. It should be pointed out that the criteria determining residence are not necessarily uniform in all reporting States.

While these data indicate a considerable degree of immigration to certain States for the purpose of getting married, they do not show the corresponding out-migration. It is, therefore, impossible to ascertain the effect of allocating marriages according to place of residence, and such classification will not be possible until tabulations of marriages by residence are available for all States.

The crude marriage rates shown in subsequent pages of this volume are based on the number of marriages occurring in a State and on its resident population. Although data on marriages by place of occurrence are useful and necessary for many purposes, tabulations by place of residence and the computation of resident rates would provide data of greater value and meaning for many uses.

Table E. LIVE BIRTHS TO NONRESIDENTS IN EACH STATE AND LIVE BIRTHS TO RESIDENTS IN OTHER STATES: UNITED STATES, 1954

(Based on a 50-percent sample. Unit of residence is defined as the individual urban place, or the rural area of the county, of which the mother was a resident. Urban places include every incorporated place having a population of 2,500 or more in 1950, as well as certain unincorporated places classified as "urban" under special rules)

¹Excludes 3,797 marriages in New Orleans.²Incomplete.³Excludes 69,900 marriages for which licenses had been issued in New York City.

Territories and possessions

Geographic classification.—Data on births and deaths for geographic subdivisions of these areas are shown in one table. In this table, the primary subdivision is the county or the equivalent of the county, which is designated as the “judicial division” in Alaska, the “county” in Hawaii, and the “municipality” in Puerto Rico and the Virgin Islands.

A further geographic subdivision for which data are shown separately is the individual urban place. Figures for births and deaths are given for each place in Hawaii and Puerto Rico, having a population of 10,000 or more, and for each place in Alaska and the Virgin Islands with a population of 2,500 or more according to the 1950 census. For Alaska, information is also presented for recording districts which correspond to minor civil divisions.

All geographic data for these areas are by place of occurrence. Because of the movement from rural to urban place for hospitalization at time of birth or death, the figures by place of occurrence cannot be used for many local areas as indicative of the level of fertility or mortality.

Race.—Births and deaths are classified in detail by special classifications adopted in accordance with the composition of the population of each area. These classifications correspond to those used by the Bureau of the Census in the 1950 census. However, in this report, figures are shown only for the two major groups, “White” and “Nonwhite,” with the exception of one summary table for births and deaths where the detailed classifications are shown.

The classifications used for Alaska, Hawaii, Puerto Rico, and the Virgin Islands are indicated below together with an explanation of some of the groups.

Alaska:

White

Native (including Eskimo, Aleut, Indian, and mixed, except part Negro)

Other races

Hawaii:

Hawaiian and Part-Hawaiian

Caucasian

Chinese

Japanese

Filipino

Other races (including Negro, Korean, and those described as “Puerto Rican”)

Puerto Rico (same as for continental United States):

White

Nonwhite

Virgin Islands:

White

Negro

Mixed (any combination) and other races

There may be a problem of comparability between census and vital record information on race in some areas. Differences in reporting race may also arise between birth and death records, and lack of comparability here would affect infant and maternal mortality rates.

Attendant at birth.—In Alaska and Hawaii, birth data are shown for the customary three categories—“physician in hospital,” “physician not in hospital,” and “midwife.” In Puerto Rico and the Virgin Islands, however, a slight modification was made in the classification because of the large proportion of births in hospitals attended by other than

physicians. In these areas, births were classified as occurring “in hospital” or “not in hospital.” For those births “not in hospital” the distribution by attendant is also shown.

Cause of death.—For rules governing the classification by cause of death see p. XIX.

Completeness of registration.—All of the data for Alaska, Hawaii, Puerto Rico, and the Virgin Islands refer to registered events. Completeness of registration of births, deaths, marriages, and divorces is therefore a factor to be considered in the interpretation of the data. Tests of birth registration were made for all of these areas in 1950, and for all, except Alaska, in 1940. The results of these tests are given in chapter 6, “Vital Statistics of the United States, 1950, Volume I.”

Guide to tabulations

The National Office of Vital Statistics tabulates a large volume of statistical material. Since only the tabulations that seem most important or of general interest can be published, some of the data available are never printed. Nevertheless, the unpublished data are available to research workers and to many others having specialized interests.

Table H, “Guide to the Tabulations for 1954,” is printed here for the use of those persons who may need certain statistical data which have not been published.

In the tabular outline, each tabulation is described separately. Column headings show all of the different classifications of subject matter used in the general body of data being described, and the stub shows the scope of the tabulation. The notations in the stub indicate whether the tabulation was made for each State or for the United States, or for selected areas only.

The many interrelations of data within this framework are shown by simple notations. In the horizontal rows for each tabulation, and under each subject-classification are placed alphabetical notations which indicate the interrelations within the particular tabulation. Within each tabulation, subjects noted by X are cross-tabulated with each other and with all lettered subjects; for example, in mortality tabulation IV (see table) deaths for each State are tabulated by cause of death and the cause groups in turn are cross-tabulated by race and sex. The resulting cause-race-sex groups are then tabulated by age, by month of death, and by autopsy. However, the lettered subjects (age, month of death, and autopsy) are not cross-tabulated with each other.

The only exception to this general principle is the case where two or more lettered subjects are cross-tabulated with each other but are not crossed with other lettered subjects in the tabulation. In such cases, the same letter is used to indicate those which are cross-tabulated. For example, in natality tabulation I, race is cross-classified with sex, attendant at birth, legitimacy, and birth weight. However, sex, attendant at birth, legitimacy, and birth weight are not cross-classified with each other.

The detail in which some of the items have been tabulated is not indicated in this guide. Class intervals for the same item may vary between tabulations. The purpose of the guide is to indicate the scope of data included in the vital statistics tabulating program. Specific information on the detail available for any item may be had from the National Office of Vital Statistics.

SUMMARY TABLES

Table H. Guide to the Tabulations for 1954

MORTALITY

Tabulation numbers	AREA	County and city	Population-size groups	Metropolitan and nonmetropolitan groupings of counties	CAUSE OF DEATH				Race	Sex	Age	Month of death	Autopsy
					Complete International List	256 Selected causes	64 Selected causes	33 Selected causes					
					Infant, 45 Selected causes								
I	United States								X	X			
II	Each State ¹					X							
III	Each State ²	X	X	X				a	b	b	c		
IV	Each State ³						X		X	X	a	b	c
V	Each urban place of 100,000 or more and each metropolitan area ¹								X	X	X		
VI	Each State (deaths under 1 year) ¹		a	b					X	X	X	c	

NATALITY

Tabulation numbers	AREA	County and city	Population-size groups	Metropolitan and nonmetropolitan groupings of counties	Race	Sex	Nativity of white mother	Age of mother	Age of father	Month of birth	Attendant at birth	Period of gestation ⁴	Legitimacy ⁴	Birth weight ⁴	NUMBER OF CHILDREN ¹		PLURAL SETS (including fetal deaths)		
															Total born alive	First child born alive	Twins, triplets, etc.	Number born alive	Sex of mates
I	Each State ²	X	X	X	a, b, c, d	a					b	c	d						
II	Each State ¹				X	X	X	X	a	b			c		d	b			
III	Each State (plural birth) ¹				X			X									X	X	X

FETAL MORTALITY⁵

I	Each State ¹	X	X	X	X						X	X							
II	Each State ¹				X	X	X	X	a	b		c	d	e	f				

¹Data available on a residence basis only.
²Data available on an occurrence basis and on a residence basis for each urban place of 10,000 population or more, and totals are provided for each county for urban places under 10,000 population and for rural areas.
³Data available on both an occurrence and a residence basis.
⁴Data available only for States reporting this item.
⁵All tabulations include only fetal deaths for which the period of gestation was stated to be 20 weeks or more, or was not stated. Gestation age data for all fetal deaths including those under 20 weeks of gestation are available for each State (place of occurrence).

Table I. Estimated Total Population Including Armed Forces Overseas, by Age, Race, and Sex: United States, 1954

(Figures represent the sum of the total population residing in continental United States and of the armed forces overseas. Estimates were rounded to the nearest thousand without being adjusted to totals which were independently rounded)

1940	131,820,000	131,669,275	1,595,879	12.1	284,000	2.0	2,360,399	17.9	2,559,000	19.4	1,417,289	10.8

¹For 1940 and 1950, enumerated as of April 1; for other years, estimated as of July 1. Populations are given in the following publications of the U. S. Bureau of the Census: "Estimates of the Population of the United States and of the Components of Change, by Age, Color, and Sex: 1940 to 1950," Current Population Reports, Series P-25, No. 98, 1954; "Estimates of the Population of the United States, by Age, Color, and Sex: July 1950 to 1955," Current Population Reports, Series P-25, No. 121, 1955.
²Estimated for 1953 and 1954. Includes estimates and marriage licenses for some States for all years. Rates based on population excluding armed forces overseas.
³Estimated. Includes reported annulments. For 1941-46, rates based on population including armed forces overseas; for other years, on population excluding armed forces overseas.
⁴For 1951-54, based on a 50-percent sample. For 1941-46, rates based on population including armed forces overseas; for other years, on population excluding armed forces overseas.
⁵Exclusive of fetal deaths and of deaths among armed forces overseas. Rates based on population excluding armed forces overseas.
⁶Enumerated population plus estimate of armed forces overseas.

Table M. Fetal Deaths and Ratios; Infant, Neonatal, and Maternal Deaths, and Rates: United States, 1940-54

(Fetal death ratios, and infant (under 1 year) and neonatal (under 28 days) mortality rates per 1,000 live births. Maternal mortality rates per 10,000 live births)

YEAR	FETAL DEATHS ¹		DEATHS UNDER 1 YEAR ²		DEATHS UNDER 28 DAYS ²		MATERNAL DEATHS ³

November	9.4	25.3	17.4	9.4	26.6	18.2
December	9.1	25.0	16.0	9.9	28.3	18.6

¹Rate for "Total" based on estimated number of marriages; rate by month based on provisional number of marriages.
²Based on a 50-percent sample of registered births.
³Includes only fetal deaths for which the period of gestation was given as 20 weeks or more, or was not stated.
⁴Exclusive of fetal deaths and of deaths among armed forces overseas.
⁵Exclusive of fetal deaths.
⁶Annual rate adjusted by allocation of deaths to year of birth. Monthly rates adjusted by method of the Registrar-General of England and Wales. For methods of adjustment, see "Effect of Changing Birth Rates Upon Infant Mortality Rates," U.S. Bureau of the Census, Vital Statistics—Special Reports, vol. 19, No. 21, 1944.

Table O. Crude Marriage and Divorce Rates: United States, Each Division and State, 1950-54

¹It is assumed that all births in hospitals or institutions are attended by physicians.

Table Y. Birth Rates by Age of Mother, Race, and Live-Birth Order:
United States, 1953 and 1954

(Based on a 50-percent sample of births. Live-birth order refers to number of children born alive to mother. Rates are registered live births per 1,000 female population in each specified group, estimated as of July 1. Figures for births of order not stated are distributed, including births that occurred in Massachusetts, which did not require the reporting of birth order)

RACE AND LIVE-BIRTH ORDER	15-44 years ¹	AGE OF MOTHER

¹Rates computed by relating total births, regardless of age of mother, to female population aged 15-44 years. Figures for age of mother not stated are included in total, but are not distributed among the specified age groups.
²Rates computed by relating births to mothers aged 45 years and over, to female population aged 45-49 years.

SUMMARY TABLES

XXXIX

Table Z. Birth Rates Adjusted for Underregistration, by Age of Mother, Race, and Live-Birth Order: United States, 1953 and 1954

(Based on a 50-percent sample of births. Live-birth order refers to number of children born alive to mother. Rates are live births per 1,000 female population in each specified group, estimated as of July 1. Figures for age of mother and births of order not stated are distributed, including births that occurred in Massachusetts, which did not require the reporting of birth order)

SUMMARY TABLES

Table AB. Birth Rates Adjusted for Underregistration, by Live-Birth Order and Race: United States, 1940-54

(Live-birth order refers to number of children born alive to mother. Rates are live births per 1,000 female population 15-44 years of age in each specified group. Population enumerated as of April 1 for 1940 and 1950, and estimated as of July 1 for 1941-49 and 1951-54. Figures for births of order not stated are distributed, including births that occurred in Massachusetts, which did not require the reporting of birth order)

¹Rates computed by relating total births, regardless of age of father, to male population aged 15-54 years.

²Rates computed by relating the number of children whose fathers were under 20 years of age to male population aged 15-19 years.

³Based on a 50-percent sample of births.

⁴Rates based on population including armed forces overseas.

Table AD. Statistics on Live Births for Specified Characteristics: United States, 1954

(Based on a 50-percent sample. Data supplement time series of births adjusted for underregistration shown in selected tables of "Vital Statistics of the United States, Volume I, 1950." Comparable data for 1951-53 are shown in Volume I for the respective years)

Table No. in the 1950 report	SUBJECT	Data	
6.06	BIRTHS BY RACE AND SEX		
	All races-----	4,078,000	
	Male----	2,090,000	
	Female--	1,988,000	
	White-----	3,475,000	
	Nonwhite-----	1,785,000	
6.07	MALE BIRTHS PER 1,000 FEMALE BIRTHS, BY RACE		
	All races-----	1,051	
	White-----	1,056	
	Nonwhite-----	1,020	
	6.15	BIRTH RATES BY BIRTH ORDER FOR NATIVE WHITE WOMEN ¹	
		Total-----	115
First child-----		34	
Second child-----		33	
Third child-----		23	
Fourth child-----		12	
Fifth child-----		6	
Sixth child-----		3	
Seventh child-----		2	
Eighth child and over-----	3		

¹Birth order refers to number of children born alive to mother. Figures for births of order not stated are distributed, including births that occurred in Massachusetts which did not require the reporting of birth order. Rates per 1,000 native white female population aged 15-44 years, estimated as of July 1.

Table AE. Gross and Net Reproduction Rates by Race: United States, 1940-54

(Based on births adjusted for underregistration)

YEAR	GROSS REPRODUCTION RATE ¹			NET REPRODUCTION RATE ²		
	Total	White	Non-white	Total	White	Non-white
1954 ³	1,723	1,657	2,212	1,654	1,598	2,058

1943	1,323	1,294	1,543	1,228	1,211	1,348
1942	1,277	1,250	1,487	1,185	1,171	1,293
1941	1,186	1,131	1,459	1,075	1,052	1,242
1940	1,121	1,082	1,422	1,027	1,002	1,209

¹The gross reproduction rate represents the number of daughters a hypothetical cohort of 1,000 women entering the childbearing period together would have during their lives (a) if they were subject to a given set of age-specific birth rates, and (b) if none of the cohort were to die between birth and completion of the childbearing period. Thus, a cohort of 1,000 women would bear 1,723 daughters in their lifetime if they experienced the same age-specific birth rates that occurred in 1954 and no deaths occurred before the end of their reproductive age span.

²The net reproduction rate is based on the specific fertility and mortality conditions existing in a time period. A rate of 1,000 means that with the age-specific birth and death rates experienced in a certain year (or years) a cohort of 1,000 newly born girls would bear just enough daughters to replace themselves.

³Based on a 50-percent sample of births.

SUMMARY TABLES

Table AF. Percentage Distribution of Registered Live Births by Birth Weight, by Race: United States and Each Geographic Division, 1954

¹The equivalents of the gram weights in terms of pounds and ounces are as follows:
 1,000 grams or less = 2 lb. 3 oz. or less
 1,001-1,500 grams = 2 lb. 4 oz.-3 lb. 4 oz.
 1,501-2,000 grams = 3 lb. 5 oz.-4 lb. 6 oz.
 2,001-2,500 grams = 4 lb. 7 oz.-5 lb. 8 oz.
 2,500 grams or less = 5 lb. 8 oz. or less
 2,501-3,000 grams = 5 lb. 9 oz.-6 lb. 9 oz.
 3,001-3,500 grams = 6 lb. 10 oz.-7 lb. 11 oz.
 3,501-4,000 grams = 7 lb. 12 oz.-8 lb. 13 oz.
 4,001-4,500 grams = 8 lb. 14 oz.-9 lb. 14 oz.
 4,501-5,000 grams = 9 lb. 15 oz.-11 lb. 0 oz.
 5,001 grams or more = 11 lb. 1 oz. or more.

²Excludes births to residents of Connecticut and Massachusetts since birth weight data were not available for births which occurred in these States.

Table AG. Monthly Indexes of First Births and Other Live Births: United States, 1954

(Monthly average = 100. Computed from figures adjusted for length of month. Based on a 50-percent sample of registered births. First births refer to first child born alive to mother. Figures for births of order not stated are distributed, including births that occurred in Massachusetts which did not require the reporting of birth order)

MONTH	All live births	First births	Other births
January-----	97.2	97.7	97.0

Table AH. Estimated Number and Ratio of Illegitimate Live Births, by Age of Mother and Race: United States, 1954

(Estimates by race were rounded to the nearest hundred without being adjusted to group totals which were independently rounded. Ratios per 1,000 total live births in each specified group)

AGE OF MOTHER	NUMBER			RATIO		
	Total	White	Non-white	Total	White	Non-white
TOTAL-----	176,600	62,700	113,900	44.0	18.2	198.5
Under 15 years-----	3,900	800	3,100	643.8	368.3	797.7
15-19 years-----	67,200	23,200	44,000	140.6	63.1	399.8
15-17 years-----	33,600	10,200	23,400	231.5	102.2	516.4
18 and 19 years-----	33,500	13,000	20,600	100.7	48.5	318.1
20-24 years-----	53,300	20,600	32,700	42.4	19.1	184.6
25-29 years-----	26,600	8,900	17,700	23.7	9.1	127.2
30-34 years-----	15,500	5,200	10,300	21.5	8.2	119.7
35-39 years-----	7,900	3,000	4,900	23.4	10.2	113.7
40 years and over-----	2,200	1,000	1,200	23.9	12.6	94.8

NOTE.—Estimates were derived by adding an estimate of the number of illegitimate births in States for which legitimacy data were not available, to the number of reported illegitimate live births based on a 50-percent sample for the reporting States. No estimates were included for misstatements on the birth record or for failures to register births.

Table AI. Ratio of Illegitimate Live Births by Race: 35 Reporting States, 1954

(By place of residence. Based on a 50-percent sample of registered live births. Ratios are illegitimate births per 1,000 total live births in each specified group)

¹Before computation of rates, live births and fetal deaths to mothers with "Not stated" age and fetal deaths of "Sex not stated" were distributed proportionately among the stated groups.

EXPLANATION OF THE COLUMNS OF THE LIFE TABLE

Column 1--Age interval (x to $x + n$).--The age interval, shown in column 1, is the interval between the two exact ages indicated. For instance, "20-25" means the 5-year interval between the twentieth birthday and the twenty-fifth.

Column 2--Proportion dying (${}_nq_x$).--This column shows the proportion dying during the indicated age interval among those alive on the birthday which marks the beginning of the interval. For example, the proportion dying in the age interval 20-25 for the total population is .0065. In other words, if the age-specific mortality rates prevailing in 1954 should continue in effect over a 5-year period, then, out of every 1,000 persons alive and exactly 20 years old at the beginning of the period, 6.5 would die before reaching their twenty-fifth birthday. The "proportion dying" column forms the basis of the life table, all the other columns being derived from it.

Column 3--Number living (l_x).--This column shows the number of persons who survive to the exact age marking the beginning of each age interval out of a cohort of 100,000 live births, among whom the proportions dying in each age interval throughout their lives are exactly those shown in column 2. Thus, out of 100,000 babies born alive, 97,331 will complete the first year of life and enter the second; 96,880 will begin the sixth year; 95,945 will reach age 20; and 17,988 will live to age 85.

Column 4--Number dying (${}_nd_x$).--This column shows the number dying in each successive age interval out of 100,000 live births. Out of 100,000 babies born alive, 2,669 die in the first year of life, 451 in the succeeding 4 years, 625 in the 5-year period between exact ages 20 and 25, and 17,988 die after reaching age 85. Each figure in column 4 is the difference between two successive figures in column 3.

Columns 5 and 6--Stationary population (${}_nL_x$ and T_x).--Suppose that a group of 100,000 individuals like that assumed in columns 3 and 4 is born every year, and that the proportions dying in each such group in each age interval throughout the lives of the members are exactly those shown in column 2. If there were no migration and if the births were evenly distributed over the calendar year, the survivors of these births would make up what is called a stationary population--stationary because in such a population the number of persons living in any given age group would never change. When an individual left the group, either by death or by growing older and entering the next higher age group, his place would immediately be taken by someone entering from the next lower age group. Thus, a census taken at any time in such a stationary community would always show the same total population and the same numerical distribution of that population among the various age groups. In such a stationary population supported by 100,000 annual births, column 3 shows the number of persons who, each year, reach the birthday which marks the beginning of the age interval indicated in column 1, while column 4 shows the number of persons who die each year in the indicated age interval.

Column 5 shows the number of persons in the stationary population in the indicated age interval. For example, the figure given for the total population in the age interval 20-25 is 478,199. This means that in a stationary population of the total population supported by 100,000 annual births and with proportions dying in each age group always in accordance with column 2, a census taken on any date would show 478,199 persons between exact ages 20 and 25.

Column 6 shows the total number of persons in the stationary population (column 5) in the indicated age interval and all subsequent age intervals. For example, in the stationary population referred to in the last illustration, column 6 shows that there would be at any given moment a total of 5,024,587 persons who have passed their twentieth birthday. The population at all ages 0 and above (in other words, the total population of the stationary community) would be 6,957,770.

Column 7--Average remaining lifetime (e_x).--The average remaining lifetime (also called the complete expectation of life) at any age is the average number of years remaining to be lived by those surviving to that age, on the basis of a given set of age-specific rates of dying. In order to arrive at this value, it is first necessary to observe that the figures in column 5 of the life tables can also be interpreted in terms of a single life table cohort, without introducing the concept of the stationary population. From this point of view, each figure in column 5 represents the total time (in years) lived between the two indicated birthdays by all those reaching the earlier birthday among the survivors of a cohort of 100,000 live births. Thus, the figure 478,199 for the total population in the age interval 20-25 is the total number of years lived between the twentieth and twenty-fifth birthdays by the 95,945 (column 3) who reach the twentieth birthday out of 100,000 persons born alive. The corresponding figure in column 6 (5,024,587) is the total number of years lived after attaining age 20 by the 95,945 persons reaching that age. This number of years divided by the number of persons (5,024,587 divided by 95,945) gives 52.4 years as the average remaining lifetime of the total population at age 20.

Care must be exercised in drawing conclusions from the figures in column 7. For example, in table AL it is observed that the average lifetime of white persons is greater than that of nonwhite. However, one should not conclude that the oldest ages reached by white persons necessarily exceed those attained by the most long-lived nonwhite. The difference in the average length of life is due to the fact that a greater proportion of nonwhites die before reaching old age. For example, the number surviving at age 65 out of 100,000 born alive is far greater among whites than among nonwhites; yet the average length of life remaining at age 65 is about the same for both groups.

Table AK. ABRIDGED LIFE TABLE FOR THE TOTAL POPULATION: UNITED STATES, 1954

AGE INTERVAL	PROPORTION DYING	OF 100,000 BORN ALIVE		STATIONARY POPULATION		AVERAGE REMAINING LIFETIME

¹Includes deaths among armed forces overseas at ages 50 years and over. Rate based on population 15-59 years of age.

²Based on enumerated population adjusted for age bias in the nonwhite population.

NOTES:

Excludes deaths among armed forces overseas for which age and race were not stated as follows: 1950, 132; 1951, 106; 1952, 17; 1953, 9; 1954, 1.

For 1950, rates based on population enumerated as of April 1, plus estimates of armed forces overseas, for 1951-54, based on population estimated as of July 1.

SUMMARY TABLES

¹Figures for age not stated included in the "Total," but not distributed among the specified age groups.

²Rates based on population as enumerated, i. e., not adjusted for age bias in nonwhite population at ages 55-69 years. Rates for the United States based on population adjusted for age bias are shown in table AG.

SUMMARY TABLES

Table AQ. Death Rates for 64 Selected Causes, by Age, Race, and Sex:
United States, 1954

(Exclusive of fetal deaths and of deaths among armed forces overseas. Rates per 100,000 estimated midyear population in each specified group, excluding armed forces overseas. Numbers after causes of death are category numbers of the Sixth Revision of the International Lists, 1948)

¹None of these cases fulfill the generally accepted criteria for a diagnosis of smallpox.

²Disease not notifiable.

³Includes cases of erysipelas.

NOTE.—For reported cases of certain other notifiable diseases by State, see "Morbidity and Mortality Weekly Report, Annual Supplement, Reported Incidence of Notifiable Diseases in the United States, 1954," vol. 3, No. 53, 1955, by the National Office of Vital Statistics.

TERRITORIES AND POSSESSIONS
ALASKA, HAWAII, PUERTO RICO, AND VIRGIN ISLANDS

¹Includes births in hospitals or institutions attended by physicians, midwives, or other persons.

²Births not in hospital attended by "other and not specified" persons are not shown separately, but are included in total births.

³The equivalents of the gram weights in terms of pounds and ounces are as follows: 2,500 grams or less = 5 lb. 8 oz. or less; 2,501 grams or more = 5 lb. 9 oz. or more.

GENERAL TABLES

Table 15D. Live Births by Attendant and Birth Weight; Fetal Deaths; and Total, Infant, and Neonatal Deaths; by Race: Virgin Islands, Each Municipality, and Specified Urban Places, 1954

(By place of occurrence. Includes data for all urban places with populations of 2,500 or more in 1950. Fetal deaths include only those for which the period of gestation was given as 20 weeks or more, or was not stated)

Table 18. Cases of Plural Births Classified by Number of Children Born Alive and Born Dead, by Race: Specified Areas, 1954

(By place of occurrence. For Hawaii and Puerto Rico, cases of twin births in which only one child was born alive are based on a 50-percent sample. All other cases of plural births are based on a total count. Cases of plural fetal deaths are included only if the period of gestation was given as 20 weeks or more, or was not stated)

¹Specified grounds included in "Other," which formed 10 percent or more of the total number of divorces and annulments in a State, are shown separately below:

Alabama: Abandonment-----	3,669
Arkansas: Indignities-----	4,797
Kansas: Gross neglect-----	1,180
Missouri: Indignities-----	9,610
New Hampshire: Treatment injurious to health and/or reason-----	369
Ohio: Gross neglect and extreme cruelty-----	7,652
Gross neglect and neglect of duty-----	10,751
Tennessee: Abandonment-----	1,945
Vermont: Living apart 3 years-----	128
Wyoming: Intolerable indignities-----	860

²Excludes data for Connecticut. Divorces and annulments not tabulated separately.

³Incomplete.

NOTE.—Legal grounds for decrees reported by States, which appeared to be closely related, were included in the categories listed in the tables as follows: Adultery includes "infidelity." Bigamy includes "bigamy (illegal marriage)." Conviction of crime includes: "conviction of crime (penitentiary)," "conviction of felony," "felony," and "imprisonment." Cruelty includes: "cruel and inhuman treatment," "extreme cruelty," and "physical cruelty." Desertion includes: "constructive desertion" and "wilful desertion." Drunkenness includes: "habitual intemperance," "habitual drunkenness," "intemperance," and "intoxication." Fraud includes: "fraud or misrepresentation of facts when married," "fraudulent contract," and "license obtained fraudulently." Insanity includes: "insanity at time of marriage," "mental incapacity," "unsound mind," and "incurable." Under age includes: "marriage under age of consent" and "not legal age."

GENERAL NATALITY AND MORTALITY

LIVE BIRTHS, FETAL DEATHS, DEATHS

Table 18. Live Births by Attendant and Birth Weight; Fetal Deaths; and Total, Infant, and Neonatal Deaths; by Race: United States, Each State and County, and Specified Urban Places, 1954

(Data are shown for each urban place with a population of 10,000 or more in 1950, except those in Massachusetts; for explanation, see text. Figures for white and non-white are shown separately for those counties and urban places in which the 1950 populations for nonwhite races formed 10 percent or more of the total, or numbered 10,000 or more. Births based on a 50-percent sample. Fetal deaths include only those for which the period of gestation was given as 20 weeks or more, or was not stated. Deaths exclusive of deaths among armed forces overseas)

¹Births attended by "other and not specified" persons are not shown separately but are included in total births. For the United States, these births totaled 11,468 in 1954.

²It is assumed that all births in hospitals or institutions are attended by physicians.

³The equivalents of the gram weights in terms of pounds and ounces are as follows: 2,500 grams or less = 5 lb. 8 oz. or less; 2,501 grams or more = 5 lb. 9 oz. or more.

⁴Includes data for Texarkana, Ark., only.

⁵Classified as urban under a special rule.

⁶Since this area is difficult to identify from information given on vital records, data may be understated or overstated.

⁷Birth weight information was not available for births which occurred in Connecticut. Birth weight data shown are for births in other States to residents of Connecticut.

⁸Data are shown only for the State as a whole; for explanation, see text.

⁹Massachusetts did not require the reporting of birth weight. Birth weight data shown are for births in other States to residents of Massachusetts.

¹⁰Includes data for Bristol, Tenn., only.

¹¹Includes data for Texarkana, Tex., only.

¹²Independent cities have the same status as counties and are listed after counties.

¹³Those having populations of 10,000 or more include: Alexandria, Bristol, Charlottesville, Danville, Fredericksburg, Hampton, Harrisonburg, Hopewell, Lynchburg, Martinsville, Newport News, Norfolk, Petersburg, Portsmouth, Richmond, Roanoke, South Norfolk, Staunton, Suffolk, Warwick, Waynesboro, and Winchester.

¹⁴Includes data for Bristol, Va., only.

¹⁵Covington (city) reorganized from a city in Alleghany County to an independent city in 1953.

¹⁶Elizabeth City County incorporated into the independent city of Hampton in 1952.

¹⁷Warwick County incorporated as the independent city of Warwick in 1952.

¹⁸Includes data for Bluefield, W. Va., only.

NOTES:

Urban places of 10,000 or more listed in this table include incorporated places of 10,000 or more in 1950 and certain unincorporated areas classified as "urban" under special rules relating to population size and density. Areas classified as urban under these special rules are indicated by a footnote.

Certain cities are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Aurora, Colo., under Adams County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; College Park, Ga., under Fulton County; Collinsville, Ill., under Madison County; Eau Claire, Wis., under Eau Claire County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Postoria, Ohio, under Seneca County; Hannibal, Mo., under Marion County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Kansas City, Mo., under Jackson County; Pocatello, Idaho, under Bannock County; Rocky Mount, N. C., under Rash County; St. Cloud, Minn., under Stearns County; Salem, Oreg., under Marion County; Sikeston, Mo., under Scott County; Streator, Ill., under La Salle County; Takoma Park, Md., under Montgomery County; Watertown, Wis., under Jefferson County; Weirton, W. Va., under Hancock County; and Youngstown, Ohio, under Mahoning County. Likewise, total figures for Yellowstone National Park are shown under Wyoming.

Table 19. Live Births by Attendant and Birth Weight; Fetal Deaths and Ratios; Total Deaths; and Infant and Neonatal Deaths and Rates; by Race for Urban and Rural Areas in Metropolitan and Nonmetropolitan Counties: United States and Each State, 1954

(By place of residence. Births based on a 50-percent sample. Fetal deaths include only those for which the period of gestation was given as 20 weeks or more, or was not stated. Deaths exclusive of deaths among armed forces overseas. Fetal death ratios, and infant (under 1 year) and neonatal (under 28 days) mortality rates per 1,000 live births in each specified group)

¹Births attended by "other and not specified" persons are not shown separately but are included in total births. For the United States, these births totaled 11,468 in 1954.

²It is assumed that all births in hospitals or institutions are attended by physicians.

³The equivalents of the gram weights in terms of pounds and ounces are as follows: 2,000 grams or less = 4 lb. 6 oz. or less; 2,001-2,500 grams = 4 lb. 7 oz.-5 lb. 8 oz.; 2,501 grams or more = 5 lb. 9 oz. or more.

⁴Includes estimates for Massachusetts, for explanation, see text.

⁵Birth weight information was not available for births which occurred in Connecticut. Birth weight data shown are for births in other States to residents of Connecticut.

⁶Data are shown only for the State as a whole; for explanation, see text.

⁷Massachusetts did not require the reporting of birth weight. Birth weight data shown are for births in other States to residents of Massachusetts.

NOTE.—The category "metropolitan counties" includes all counties within the State that are in "standard metropolitan areas" as defined by the Bureau of the Census in 1950, except in New England where the counties are those in the "metropolitan State economic areas," also as defined by the Bureau of the Census in 1950. The category "non-metropolitan counties" includes all other counties in the State. The "urban-rural" classification is based on the "old" (1940) definition of the Bureau of the Census, in which "urban" consists of incorporated places of 2,500 population or more in the 1950 census and a number of other places defined as urban under special rules. "Rural" includes all other areas. For further discussion of the "metropolitan-nonmetropolitan" and "urban-rural" classifications, see text.

LIVE BIRTHS

Table 20. Live Births by State of Occurrence Distributed According to State of Residence: United States and each State, 1954

¹Unit of residence is defined as the individual urban place, or the rural area of the county, of which the mother was a resident. Urban places include every incorporated place having a population of 2,500 or more in 1950, as well as certain unincorporated places classified as "urban" under special rules. For further discussion of residence allocation rules, see text.

²Includes estimates for Massachusetts; for explanation, see text.

Table 24A. Live Births by Age of Mother, Live-Birth Order, Sex of Child, Race, and Nativity of White Mother: United States, 1954

(Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Births which occurred in Massachusetts are included in the "Not stated" classification for birth order because this State did not require reporting on the item)

AGE OR MOTHER, SEX OF CHILD, RACE, AND NATIVITY OF WHITE MOTHER	Total	LIVE-BIRTH ORDER

Table 24B. Live Births by Age of Mother, Live-Birth Order, Race, and Nativity of White Mother: Each State, 1954

(By place of residence. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Births to white mothers whose nativity was not stated are not shown separately, but are included in "White." "Negro" is shown separately only in those States where the total number of births so classified was 100 or more. "Other races" in these States may be obtained by subtracting "Negro" from "Nonwhite")

Table 25. Live Births by Single Year of Age of Mother, Live-Birth Order, Race, and Nativity of White Mother: United States, 1954

(Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Births which occurred in Massachusetts are included in the "Not stated" classification for birth order because this State did not require reporting on the item)

AGE OF MOTHER, RACE, AND NATIVITY OF WHITE MOTHER	Total	LIVE-BIRTH ORDER

Table 26. Cases of Plural Births Classified by Number of Children Born Alive and Born Dead, by Race and Sex for the United States and Each State; and by Age of Mother for the United States: 1954

(By place of residence. Cases of twin births in which only one child was born alive are based on a 50-percent sample. All other cases of plural births are based on a total count. Cases of plural fetal deaths are included only if the period of gestation was given as 20 weeks or more, or was not stated. Age intervals for which no cases were reported are not shown)

¹The equivalents of the gram weights in terms of pounds and ounces are as follows:
 1,000 grams or less = 2 lb. 3 oz. or less
 1,001-1,500 grams = 2 lb. 4 oz.-3 lb. 4 oz.
 1,501-2,000 grams = 3 lb. 5 oz.-4 lb. 6 oz.
 2,001-2,500 grams = 4 lb. 7 oz.-5 lb. 8 oz.
 2,501-3,000 grams = 5 lb. 9 oz.-6 lb. 9 oz.
 3,001-3,500 grams = 6 lb. 10 oz.-7 lb. 11 oz.
 3,501-4,000 grams = 7 lb. 12 oz.-8 lb. 13 oz.
 4,001-4,500 grams = 8 lb. 14 oz.-9 lb. 14 oz.
 4,501-5,000 grams = 9 lb. 15 oz.-11 lb. 1 oz.
 5,001 grams or more = 11 lb. 1 oz. or more.

²Birth weight information not available for births which occurred in Connecticut. Data shown are for births in other States to residents of Connecticut.
³Massachusetts did not require the reporting of birth weight. Data shown are for births in other States to residents of Massachusetts.

¹Unit of residence is defined as the individual urban place, or the rural area of the county of which the mother was a resident. Urban places include every incorporated place having a population of 2,500 or more in 1950, as well as certain unincorporated places classified as "urban" under special rules. For further discussion of residence allocation rules, see text.

²Includes estimates for Massachusetts; for explanation, see text.

¹Fetal deaths for which period of gestation was not stated (Group IV) are not shown separately, but are included in this group.²Fetal deaths attended by "other and not specified" persons are not shown separately, but are included in Total.³It is assumed that all fetal deaths in hospitals or institutions are attended by physicians.⁴Period of gestation reported in months allocated to gestation interval in weeks as follows: 5 and 6 months to "20-27 weeks"; 7 months or more to "28 weeks or more."⁵Massachusetts did not require the reporting of period of gestation. Gestation age data shown are for fetal deaths in other States to residents of Massachusetts.

Table 33. Fetal Deaths by Birth Weight and Race: United States and Each State, 1954

(By place of residence. Includes only fetal deaths for which the period of gestation was given as 20 weeks or more, or was not stated. Birth weight information was not required or was not available on all or some of the fetal death certificates used in several States. These fetal deaths are included in the "Not stated" classification)

¹Figures for "Urban," "Rural," "Metropolitan Counties," and "Nonmetropolitan Counties" include estimates for Massachusetts; for explanation, see text.

NOTE.—The category "metropolitan counties" includes all counties that are in "standard metropolitan areas" as defined by the Bureau of the Census in 1950, except in New England where the counties are those in the "metropolitan State economic areas," also as defined by the Bureau of the Census in 1950. The category "nonmetropolitan counties" includes all other counties. The "urban-rural" classification is based on the "old" (1940) definition of the Bureau of the Census, in which "urban" consists of incorporated places of 2,500 population or more in the 1950 census and a number of other places defined as urban under special rules. "Rural" includes all other areas. For further discussion of the "metropolitan-nonmetropolitan" and "urban-rural" classifications, see text.
